

Supplemental Material 2: Expanded Results

Longitudinal Associations of Well-being and Other Variables with Multidimensional Flourishing in the Global Flourishing Study

Table of Contents

Table S1. Weighted summary statistics for demographic and childhood variables.

Table S2. Weighted summary statistics for outcome variables by Wave.

Table S3. Unweighted summary statistics for demographic and childhood variables by retention status.

Table S4. Unweighted summary statistics for Wave 1 outcome variables by retention status.

Table S5. Primary analysis model--Meta-analyzed associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 by approach to address missingness (multiple imputation vs. complete case with attrition weights).

Table S6. Supplemental analysis model: explicit control of wave 1 value of each exposure--Meta-analyzed associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 by approach to address missingness (multiple imputation vs. complete case with attrition weights).

Table S7. Secure flourishing index for comparing estimated E-values across models and how missingness at Wave 2 was handled.

Table S8. Unstandardized estimates of effect sizes--Meta-analyzed associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 by analysis model (Model 1 vs. Model 2).

Figure S1-76. Heterogeneity in the effects of *[exposure]* at Wave 2 on secure flourishing index at Wave 3 scores across countries.

Table S9-31a. Weighted summary statistics for demographic and childhood variables in *[Country]*.

Table S9-31b. Weighted summary statistics for outcome variables in *[Country]*.

Table S9-31c. Unweighted summary statistics for demographic and childhood variables in *[Country]* by retention status.

Table S9-31d. Unweighted summary statistics for Wave 1 outcome variables in *[Country]* by retention status.

Table S9-31e. *[Country]* analyses of the associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 using the full panel sample (n=207,919) with multiple imputation by analysis model (Model 1 vs. Model 2).

Table S9-31f. *[Country]* analyses of the associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 using only participants who completed all waves (n=96,684, semi-complete-case-analysis) by analysis model (Model 1 vs. Model 2).

Table S9-31g. *[Country]* sensitivity analysis of secure flourishing index exposure-wide results to unmeasured confounding using E-values across models and how missingness at Wave 2 was handled.

Table S1. Weighted summary statistics for demographic and childhood variables.

	Wave 1	Wave 2	Wave 3
Characteristic	N = 207,919	N = 128,868	N = 111,486
<i>Secure flourishing index</i>			
Mean (Standard Deviation)	7.07 (1.67)	6.97 (1.69)	6.98 (1.72)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.08, 8.25	6.00, 8.17	5.92, 8.25
(Missing)	5,656 (2.7%)	3,801 (2.9%)	2,640 (2.4%)
<i>Year of birth, n (%)</i>			
1943 or earlier (current age: 80+ years)	4,121 (2.0%)	3,312 (2.6%)	2,955 (2.7%)
1943-1953 (current age: 70-79 years)	16,923 (8.1%)	12,980 (10.1%)	11,319 (10.2%)
1953-1963 (current age: 60-69 years)	28,735 (13.8%)	19,987 (15.5%)	16,540 (14.8%)
1963-1973 (current age: 50-59 years)	32,629 (15.7%)	20,876 (16.2%)	17,926 (16.1%)
1973-1983 (current age: 40-49 years)	35,515 (17.1%)	22,282 (17.3%)	19,521 (17.5%)
1983-1993 (current age: 30-39 years)	41,156 (19.8%)	24,697 (19.2%)	22,002 (19.7%)
1993-1998 (current age: 25-29 years)	21,332 (10.3%)	11,687 (9.1%)	10,018 (9.0%)
1998-2005 (current age: 18-24 years)	27,487 (13.2%)	13,046 (10.1%)	11,203 (10.0%)
(Missing)	20 (<0.0%)	1 (<0.0%)	2 (<0.0%)
<i>Age of participant</i>			
Mean (Standard Deviation)	45.01 (17.32)	47.31 (17.37)	47.25 (17.33)
Min, Max	18.00, 99.00	18.00, 99.00	19.00, 99.00
Q1, Q3	30.00, 59.00	32.00, 61.00	32.00, 61.00
(Missing)	20 (<0.1%)	1 (<0.1%)	2 (<0.1%)
<i>Gender, n (%)</i>			
Male	100,933 (48.5%)	62,309 (48.4%)	53,818 (48.3%)
Female	105,986 (51.0%)	66,020 (51.2%)	57,228 (51.3%)
Other	602 (0.3%)	349 (0.3%)	304 (0.3%)
(Missing)	397 (0.2%)	189 (0.1%)	136 (0.1%)
<i>Respondent marital status, n (%)</i>			
Single/Never been married	53,134 (25.6%)	30,394 (23.6%)	26,327 (23.6%)
Married	110,906 (53.3%)	71,036 (55.1%)	61,582 (55.2%)
Separated	5,236 (2.5%)	3,058 (2.4%)	2,632 (2.4%)
Divorced	11,770 (5.7%)	8,189 (6.4%)	6,733 (6.0%)
Widowed	9,985 (4.8%)	6,473 (5.0%)	5,718 (5.1%)
Domestic partner	15,058 (7.2%)	8,817 (6.8%)	7,890 (7.1%)
(Missing)	1,830 (0.9%)	901 (0.7%)	605 (0.5%)
<i>Education (years), n (%)</i>			
Up to 8	45,673 (22.0%)	22,941 (17.8%)	21,437 (19.2%)
9-15	118,390 (56.9%)	72,836 (56.5%)	62,178 (55.8%)
16+	43,710 (21.0%)	33,080 (25.7%)	27,856 (25.0%)
(Missing)	146 (0.1%)	11 (<0.0%)	15 (0.0%)
<i>Employment status, n (%)</i>			
Employed for an employer	80,737 (38.8%)	53,831 (41.8%)	45,918 (41.2%)
Self-employed	37,673 (18.1%)	20,719 (16.1%)	18,916 (17.0%)
Retired	30,225 (14.5%)	22,158 (17.2%)	18,815 (16.9%)
Student	10,897 (5.2%)	5,085 (3.9%)	4,043 (3.6%)
Homemaker	21,966 (10.6%)	11,304 (8.8%)	10,442 (9.4%)
Unemployed and looking for a job	16,952 (8.2%)	8,965 (7.0%)	7,853 (7.0%)
None of these/Other	8,675 (4.2%)	5,842 (4.5%)	4,810 (4.3%)
(Missing)	794 (0.4%)	964 (0.7%)	689 (0.6%)
<i>Current religious service attendance, n (%)</i>			
More than once a week	26,587 (12.8%)	14,695 (11.4%)	14,082 (12.6%)
Once a week	39,345 (18.9%)	21,979 (17.1%)	19,755 (17.7%)
One to three times a month	20,049 (9.6%)	11,201 (8.7%)	9,680 (8.7%)
A few times a year	42,027 (20.2%)	25,852 (20.1%)	21,788 (19.5%)
Never	79,184 (38.1%)	54,551 (42.3%)	45,821 (41.1%)
(Missing)	728 (0.4%)	590 (0.5%)	360 (0.3%)
<i>Immigration status, n (%)</i>			
Born in this country	196,004 (94.3%)	121,770 (94.5%)	105,596 (94.7%)
Born in another country	9,801 (4.7%)	6,057 (4.7%)	5,060 (4.5%)
(Missing)	2,113 (1.0%)	1,041 (0.8%)	831 (0.7%)
<i>Parental marital status around age 12, n (%)</i>			
Parents were married	156,663 (75.3%)	99,668 (77.3%)	85,570 (76.8%)
Parents were divorced	17,851 (8.6%)	11,663 (9.1%)	10,021 (9.0%)
Parents were never married	15,566 (7.5%)	8,372 (6.5%)	7,391 (6.6%)
One or both of them had died	7,934 (3.8%)	4,709 (3.7%)	4,137 (3.7%)
Unsure	2,613 (1.3%)	1,231 (1.0%)	1,057 (0.9%)
(Missing)	7,292 (3.5%)	3,225 (2.5%)	3,309 (3.0%)
<i>Religious service attendance around age 12, n (%)</i>			
At least once a week	83,326 (40.1%)	50,309 (39.0%)	44,107 (39.6%)
One to three times a month	33,622 (16.2%)	19,806 (15.4%)	17,169 (15.4%)
Less than once a month	37,554 (18.1%)	23,444 (18.2%)	20,083 (18.0%)
Never	51,433 (24.7%)	34,177 (26.5%)	29,090 (26.1%)
(Missing)	1,984 (1.0%)	1,132 (0.9%)	1,037 (0.9%)
<i>Relationship with mother when growing up, n (%)</i>			
Very good	129,887 (62.5%)	78,152 (60.6%)	68,720 (61.6%)
Somewhat good	54,782 (26.3%)	35,782 (27.8%)	30,165 (27.1%)
Somewhat bad	11,253 (5.4%)	7,735 (6.0%)	6,375 (5.7%)
Very bad	4,667 (2.2%)	2,861 (2.2%)	2,441 (2.2%)
(Does not apply)	6,374 (3.1%)	3,795 (2.9%)	3,302 (3.0%)
(Missing)	957 (0.5%)	543 (0.4%)	483 (0.4%)
<i>Relationship with father when growing up, n (%)</i>			
Very good	109,389 (52.6%)	65,076 (50.5%)	57,754 (51.8%)
Somewhat good	58,054 (27.9%)	37,979 (29.5%)	31,878 (28.6%)
Somewhat bad	16,246 (7.8%)	11,007 (8.5%)	9,182 (8.2%)
Very bad	8,325 (4.0%)	5,338 (4.1%)	4,464 (4.0%)
(Does not apply)	14,533 (7.0%)	8,745 (6.8%)	7,533 (6.8%)
(Missing)	1,373 (0.7%)	723 (0.6%)	675 (0.6%)
<i>Felt like an outsider in family when growing up, n (%)</i>			
Yes	29,349 (14.1%)	18,286 (14.2%)	15,696 (14.1%)
No	174,894 (84.1%)	108,507 (84.2%)	94,085 (84.4%)
(Missing)	3,676 (1.8%)	2,076 (1.6%)	1,705 (1.5%)
<i>Experienced abuse when growing up, n (%)</i>			
Yes	29,417 (14.1%)	18,761 (14.6%)	16,127 (14.5%)
No	172,020 (82.7%)	106,522 (82.7%)	92,057 (82.6%)
(Missing)	6,482 (3.1%)	3,585 (2.8%)	3,302 (3.0%)
<i>Self-rated health when growing up, n (%)</i>			
Excellent	67,845 (32.6%)	43,652 (33.9%)	37,474 (33.6%)
Very good	65,022 (31.3%)	40,840 (31.7%)	35,088 (31.5%)
Good	49,027 (23.6%)	29,181 (22.6%)	25,299 (22.7%)
Fair	20,538 (9.9%)	12,033 (9.3%)	10,726 (9.6%)
Poor	4,957 (2.4%)	2,847 (2.2%)	2,637 (2.4%)
(Missing)	530 (0.3%)	314 (0.2%)	261 (0.2%)
<i>Subjective financial status of family growing up, n (%)</i>			
Lived comfortably	72,236 (34.7%)	44,485 (34.5%)	38,281 (34.3%)
Got by	85,597 (41.2%)	54,375 (42.2%)	46,718 (41.9%)
Found it difficult	36,621 (17.6%)	22,165 (17.2%)	19,507 (17.5%)
Found it very difficult	12,790 (6.2%)	7,511 (5.8%)	6,673 (6.0%)
(Missing)	675 (0.3%)	332 (0.3%)	307 (0.3%)
<i>Religious affiliation growing up, n (%)</i>			
Christianity	102,672 (49.4%)	62,831 (48.8%)	53,592 (48.1%)
Taoism	348 (0.2%)	214 (0.2%)	181 (0.2%)
Confucianism	73 (0.0%)	39 (0.0%)	41 (0.0%)
Primal, Animist, or Folk religion	759 (0.4%)	581 (0.5%)	401 (0.4%)
Spiritism	696 (0.3%)	234 (0.2%)	178 (0.2%)
Umbanda, Candomblé, and other African-derived religions	525 (0.3%)	178 (0.1%)	137 (0.1%)
Chinese folk/traditional religion	237 (0.1%)	129 (0.1%)	103 (0.1%)
Islam	23,959 (11.5%)	12,077 (9.4%)	11,561 (10.4%)
Hinduism	10,771 (5.2%)	5,462 (4.2%)	5,687 (5.1%)
Buddhism	8,807 (4.2%)	6,543 (5.1%)	5,062 (4.5%)
Judaism	3,789 (1.8%)	2,744 (2.1%)	2,502 (2.2%)
Sikhism	210 (0.1%)	100 (0.1%)	103 (0.1%)
Baha'i	48 (0.0%)	39 (0.0%)	39 (0.0%)
Jainism	53 (0.0%)	32 (0.0%)	30 (0.0%)
Shinto	514 (0.2%)	418 (0.3%)	321 (0.3%)
Some other religion	2,162 (1.0%)	1,762 (1.4%)	1,429 (1.3%)
No religion/Atheist/Agnostic	50,691 (24.4%)	34,522 (26.8%)	29,398 (26.4%)
(Missing)	1,605 (0.8%)	963 (0.7%)	721 (0.6%)

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S2. Weighted summary statistics for outcome variables by Wave.

Happiness & life satisfaction			
Mean (Standard Deviation)	6.91 (2.25)	6.73 (2.21)	6.72 (2.23)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.50, 8.50	5.50, 8.00	5.50, 8.00
(Missing)	1,043 (0.5%)	577 (0.4%)	585 (0.5%)
Physical & mental health			
Mean (Standard Deviation)	7.31 (2.11)	7.12 (2.07)	7.13 (2.09)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S8. Unstandardized estimates of effect sizes--Meta-analyzed associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 by analysis model (Model 1 vs. Model 2).

Exposure	Model 1 - implicit control of baseline value of exposure												Model 2 - explicit control of baseline value of exposure											
	Pooled Estimate			Heterogeneity			Reliability Corrected Est. (95% CI)			Pooled Estimate			Heterogeneity			Reliability Corrected Est. (95% CI)

<i>Social Well-Being</i>																								

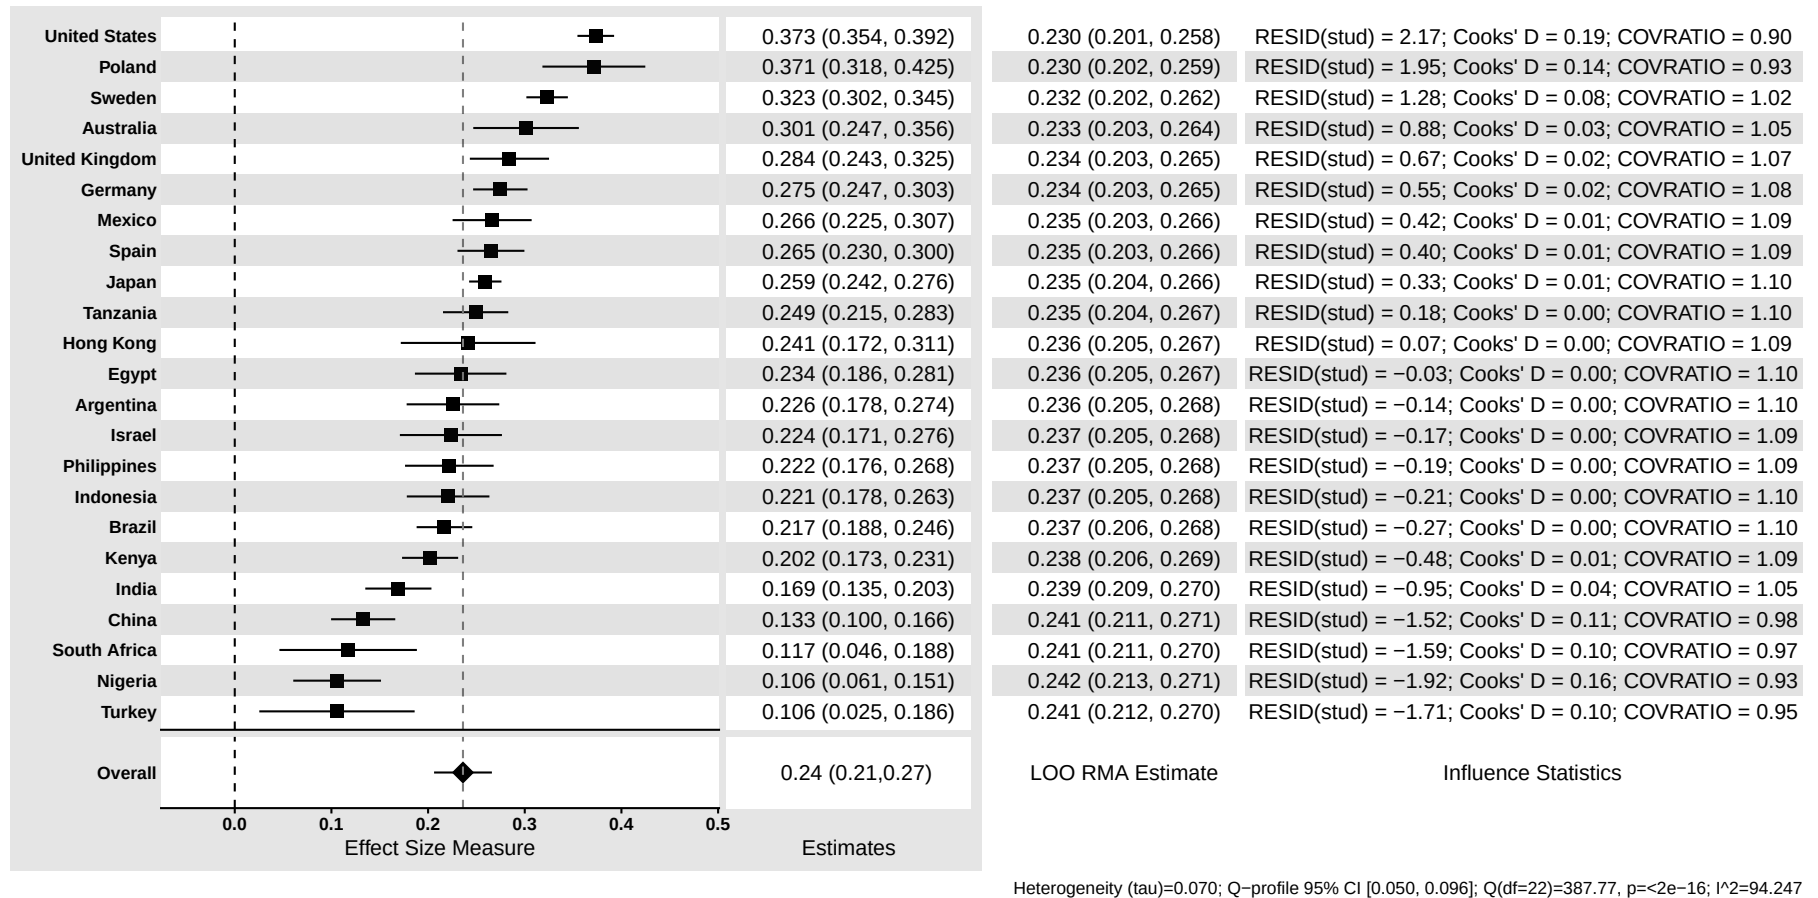

Figure S1. *Heterogeneity in the effects of happiness & life satisfaction at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

Heterogeneity (tau)=0.073; Q-profile 95% CI [0.053, 0.100]; Q(df=22)=435.76, p=<2e-16; I²=94.681

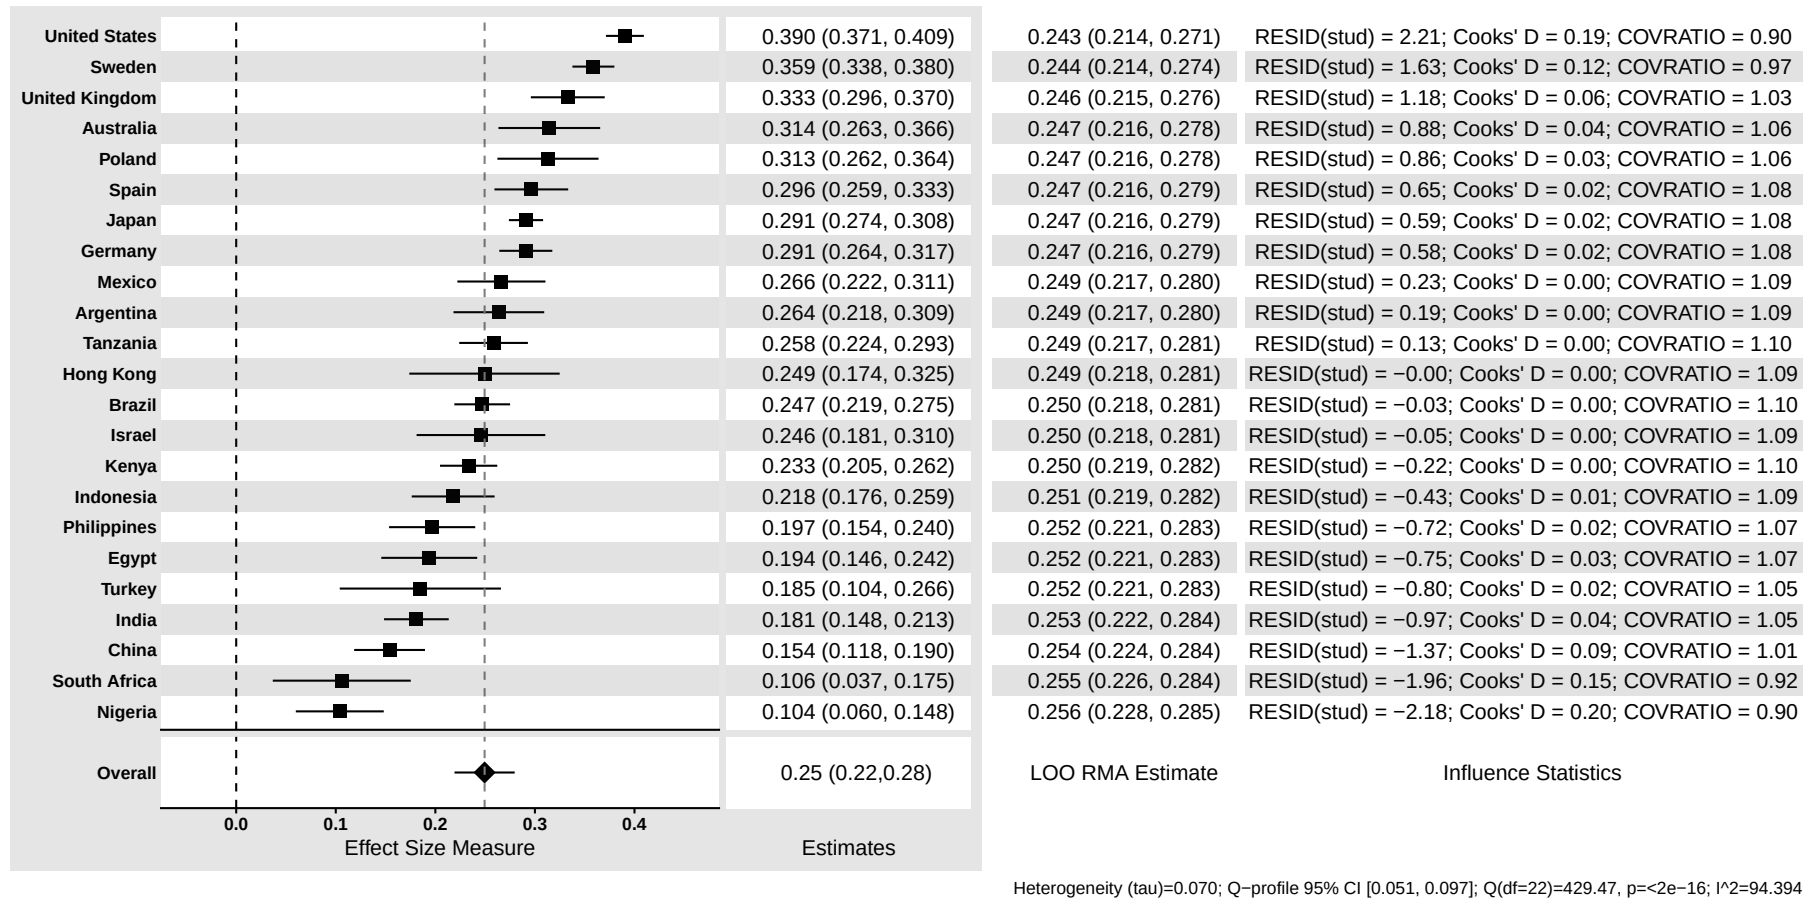

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S2. Heterogeneity in the effects of physical & mental health at Wave 2 on secure flourishing index at Wave 3 scores across countries.

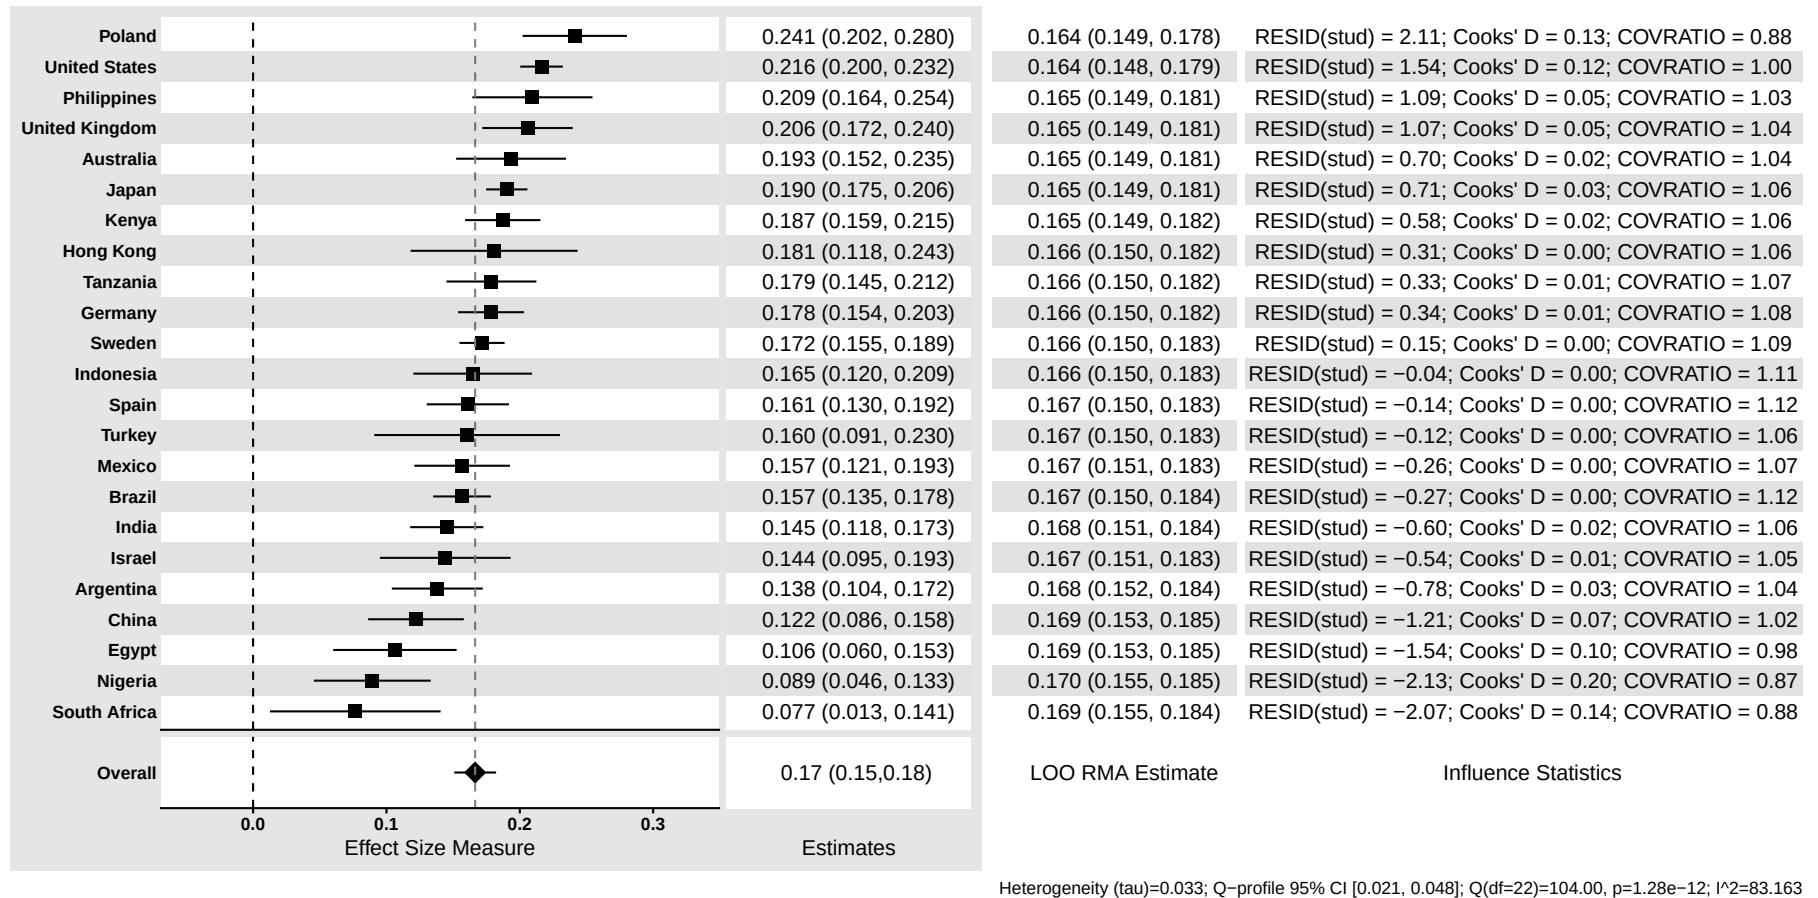

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S3. Heterogeneity in the effects of meaning & purpose at Wave 2 on secure flourishing index at Wave 3 scores across countries.

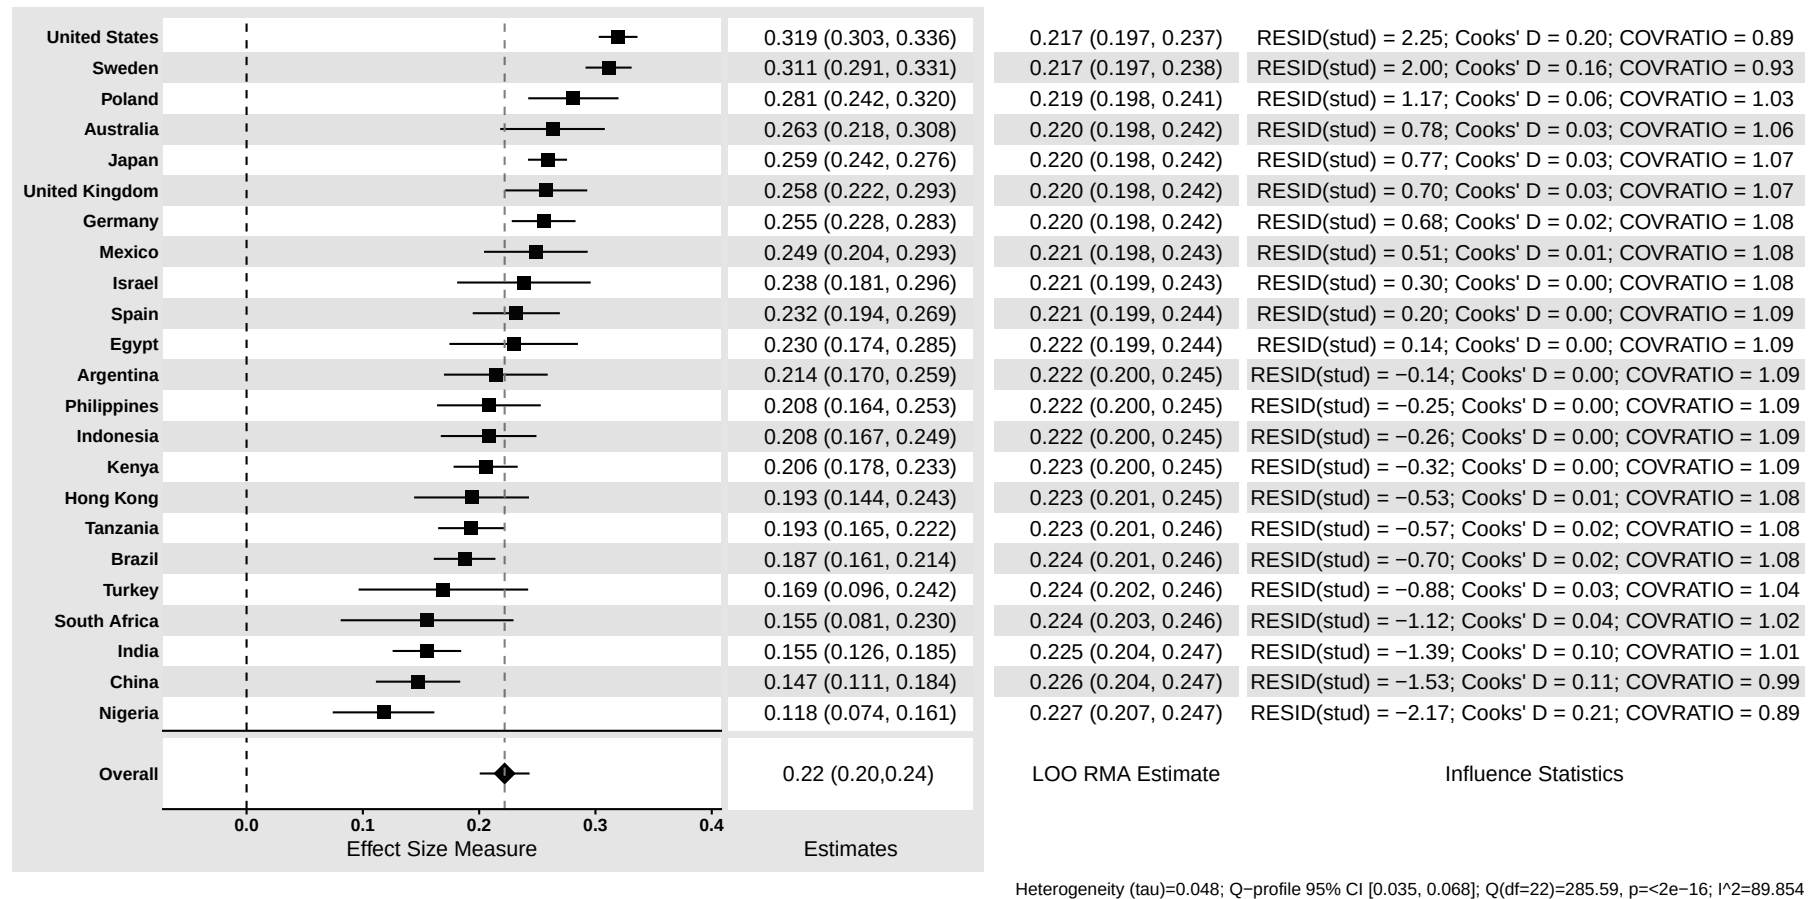

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S4. *Heterogeneity in the effects of character & virtue at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

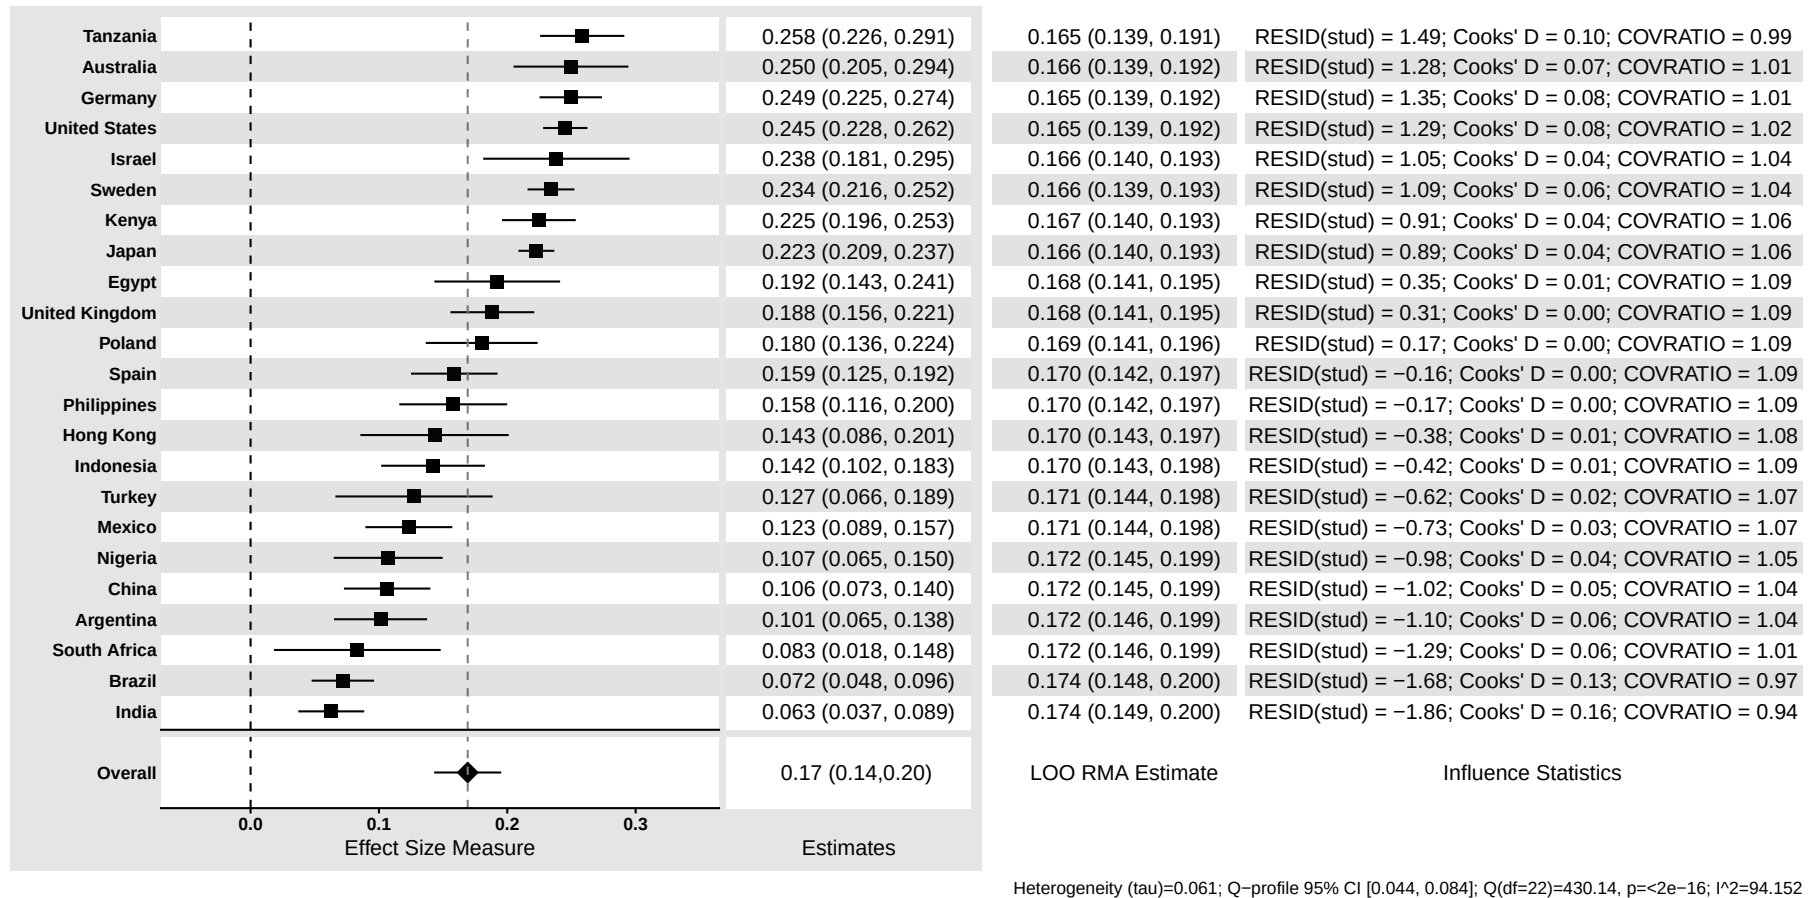

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S5. *Heterogeneity in the effects of close social relationships at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

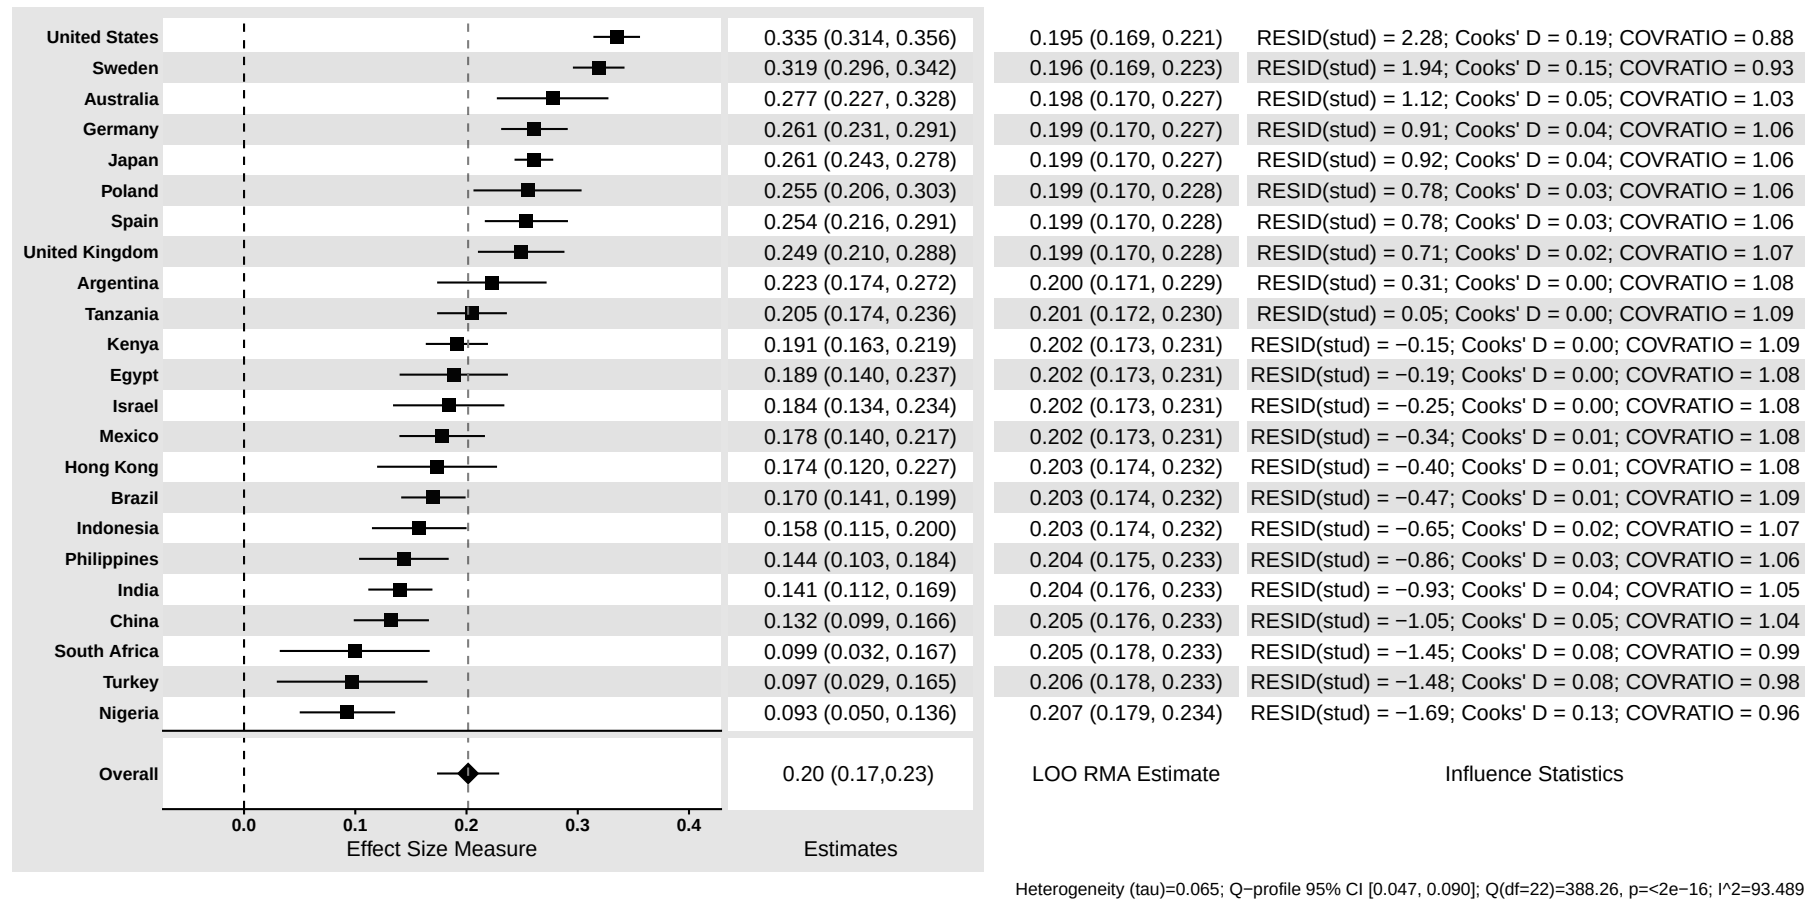

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S6. *Heterogeneity in the effects of financial & material security at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

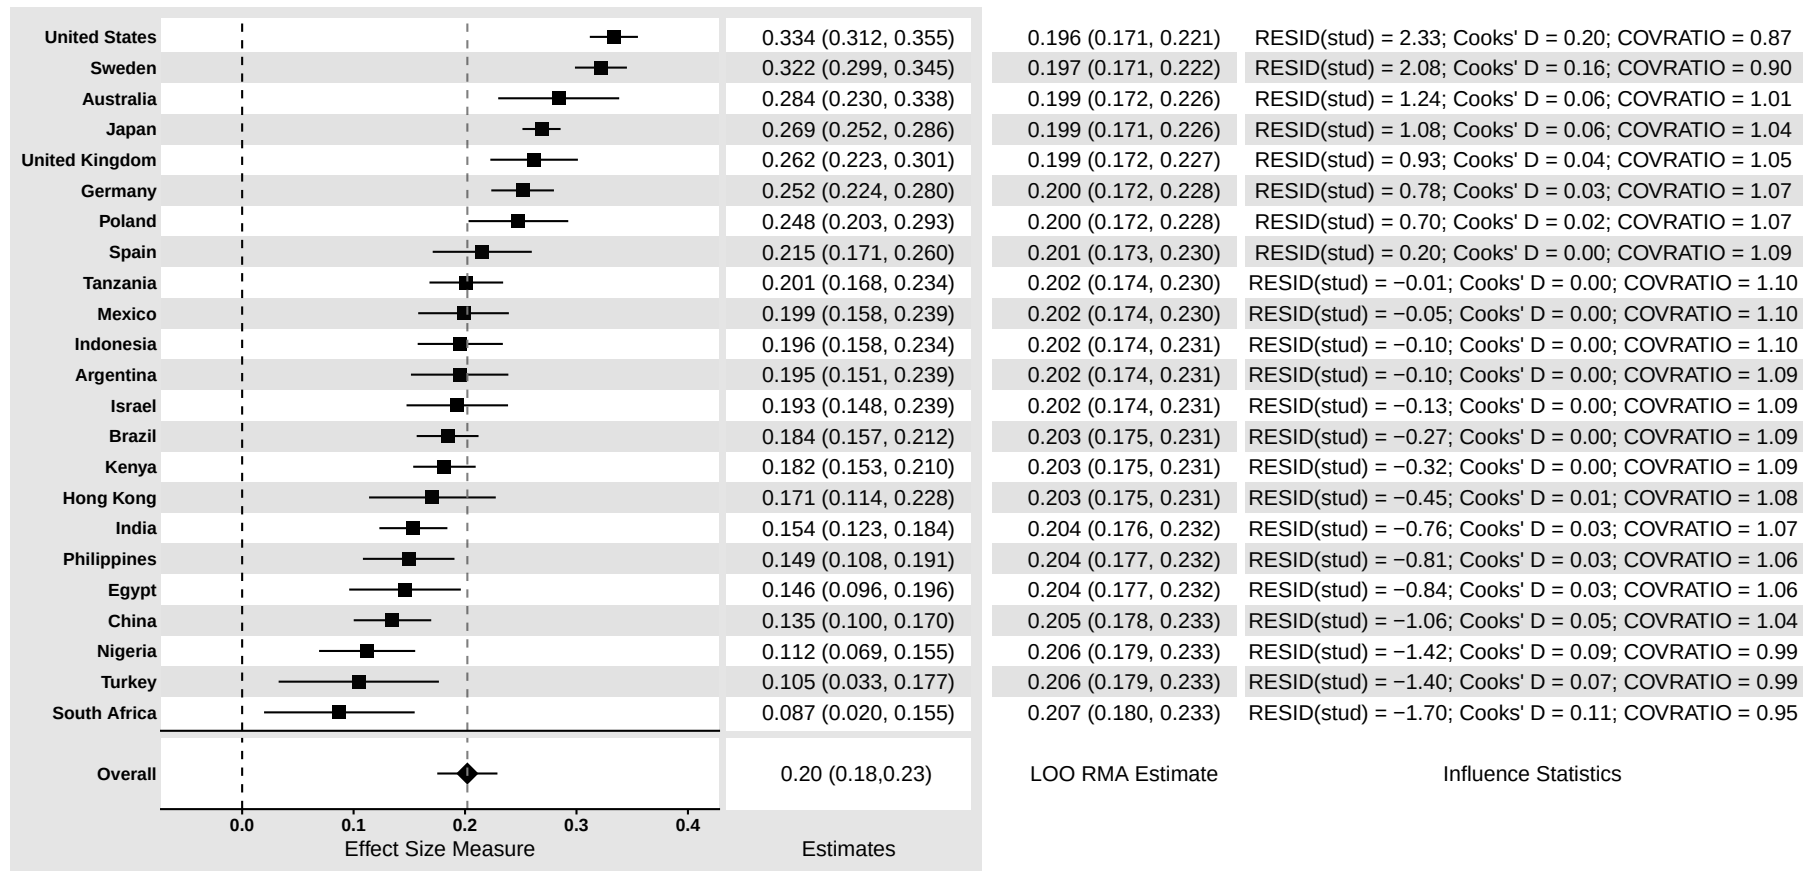

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S7. Heterogeneity in the effects of happiness at Wave 2 on secure flourishing index at Wave 3 scores across countries.

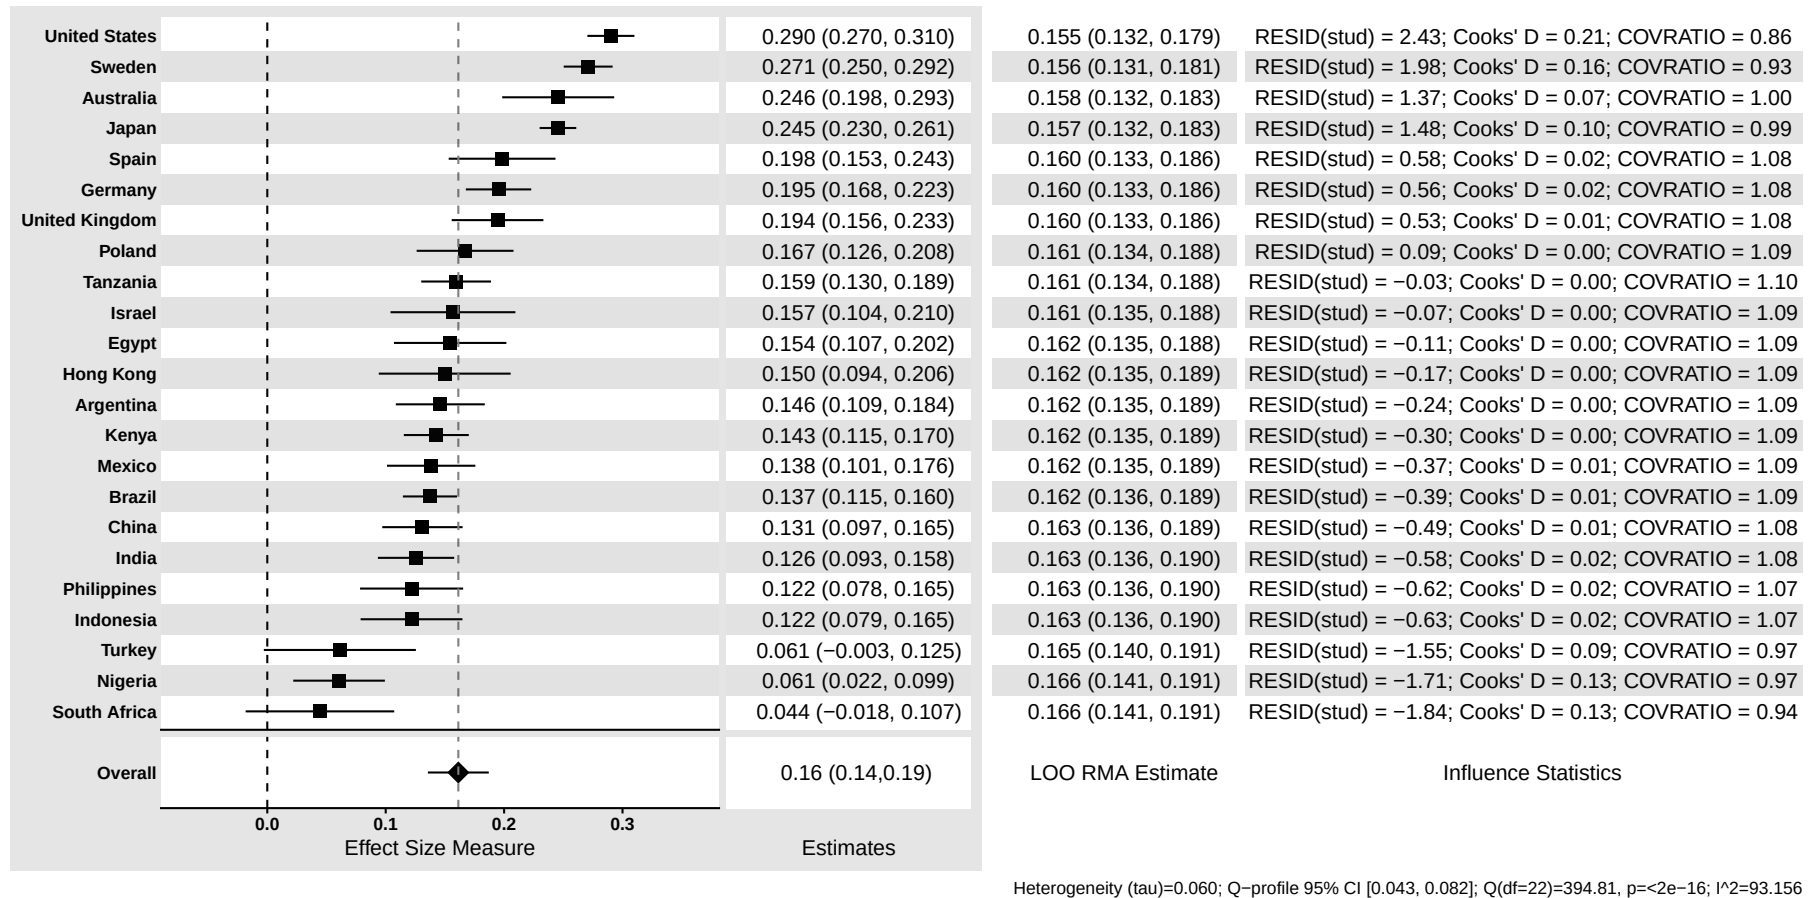

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S8. *Heterogeneity in the effects of life satisfaction at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

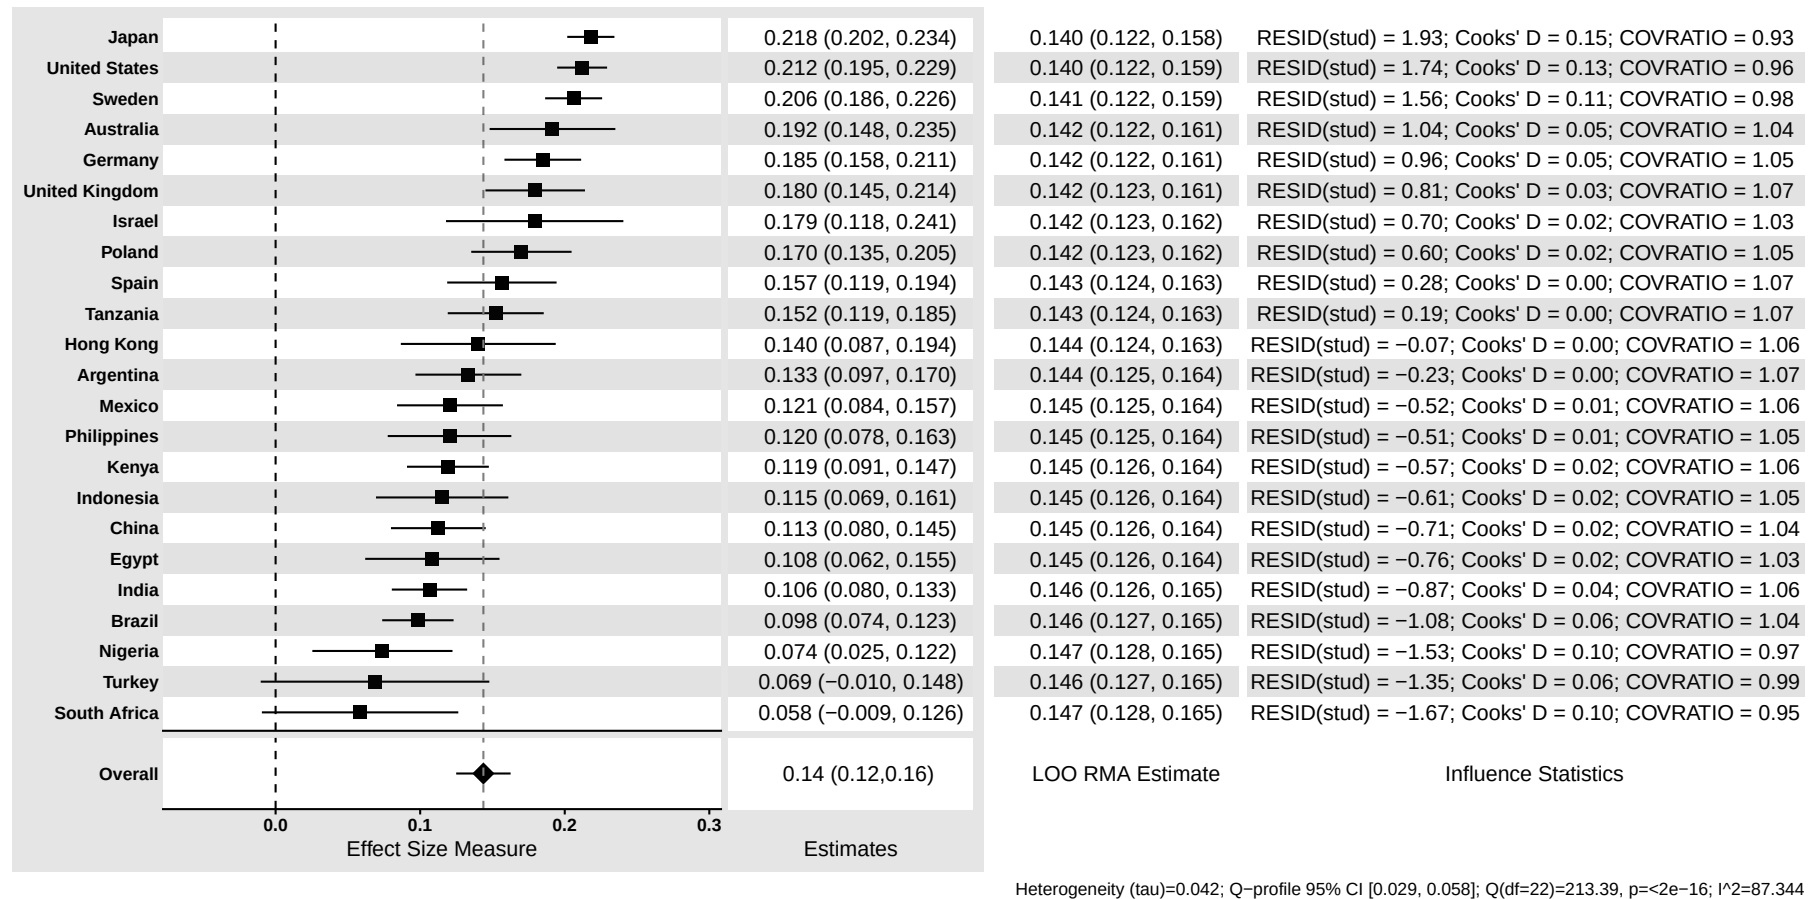

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S9. Heterogeneity in the effects of current life evaluation at Wave 2 on secure flourishing index at Wave 3 scores across countries.

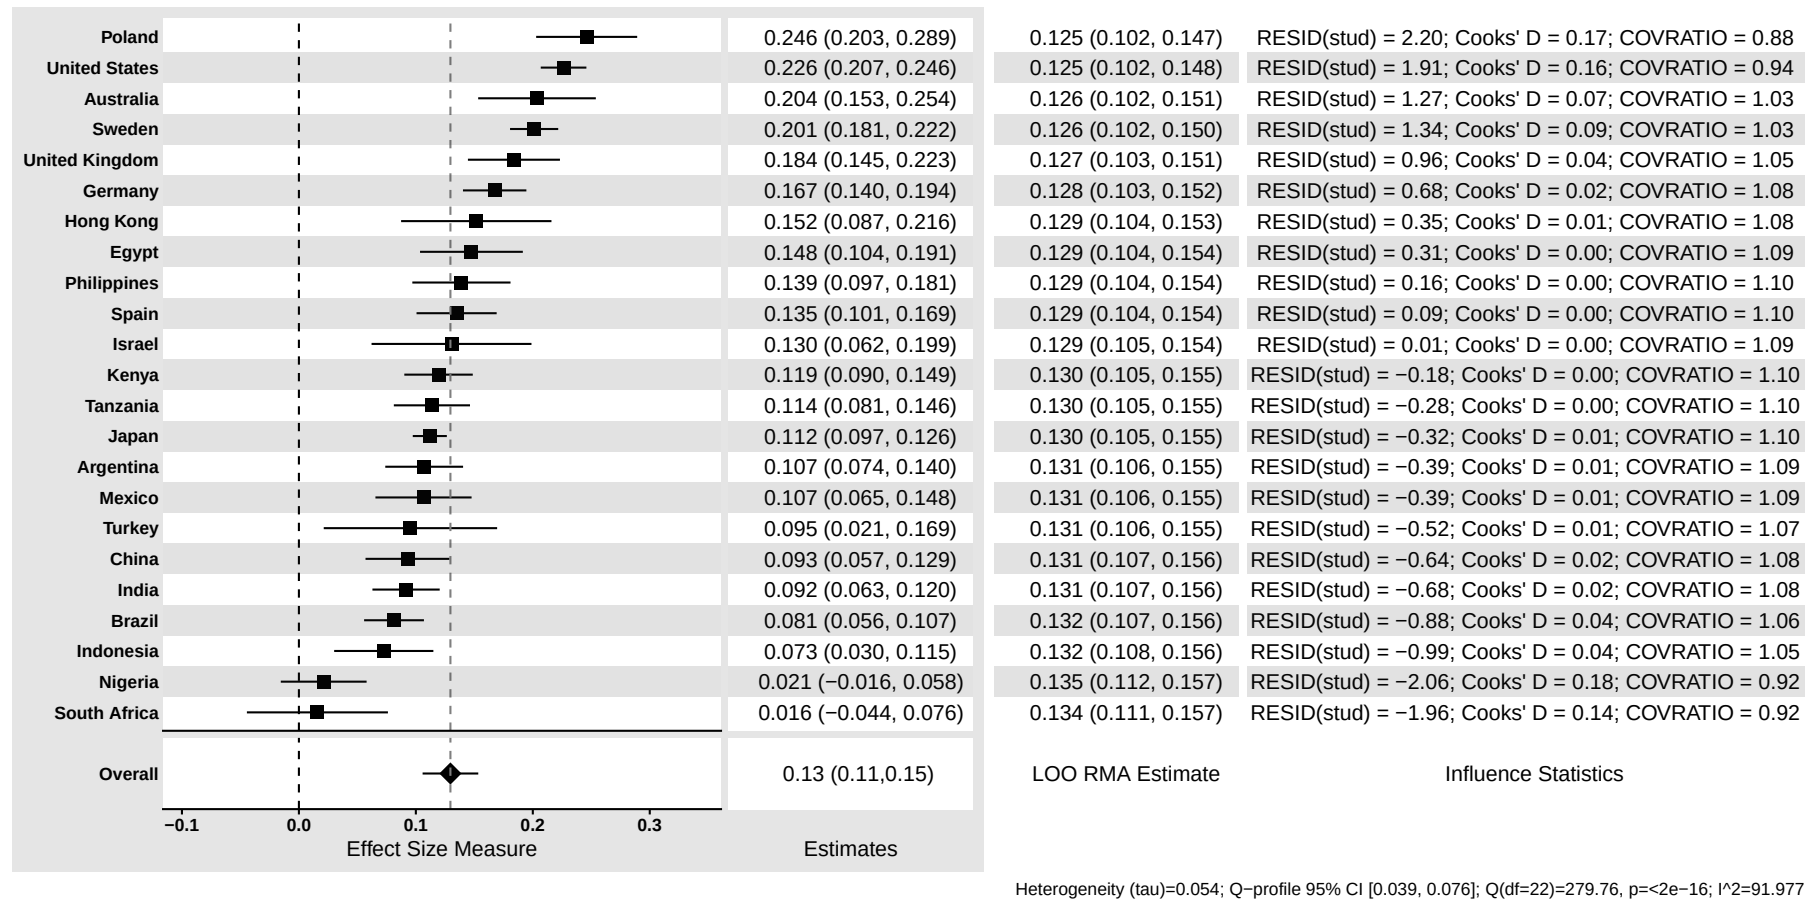

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S10. Heterogeneity in the effects of future life evaluation at Wave 2 on secure flourishing index at Wave 3 scores across countries.

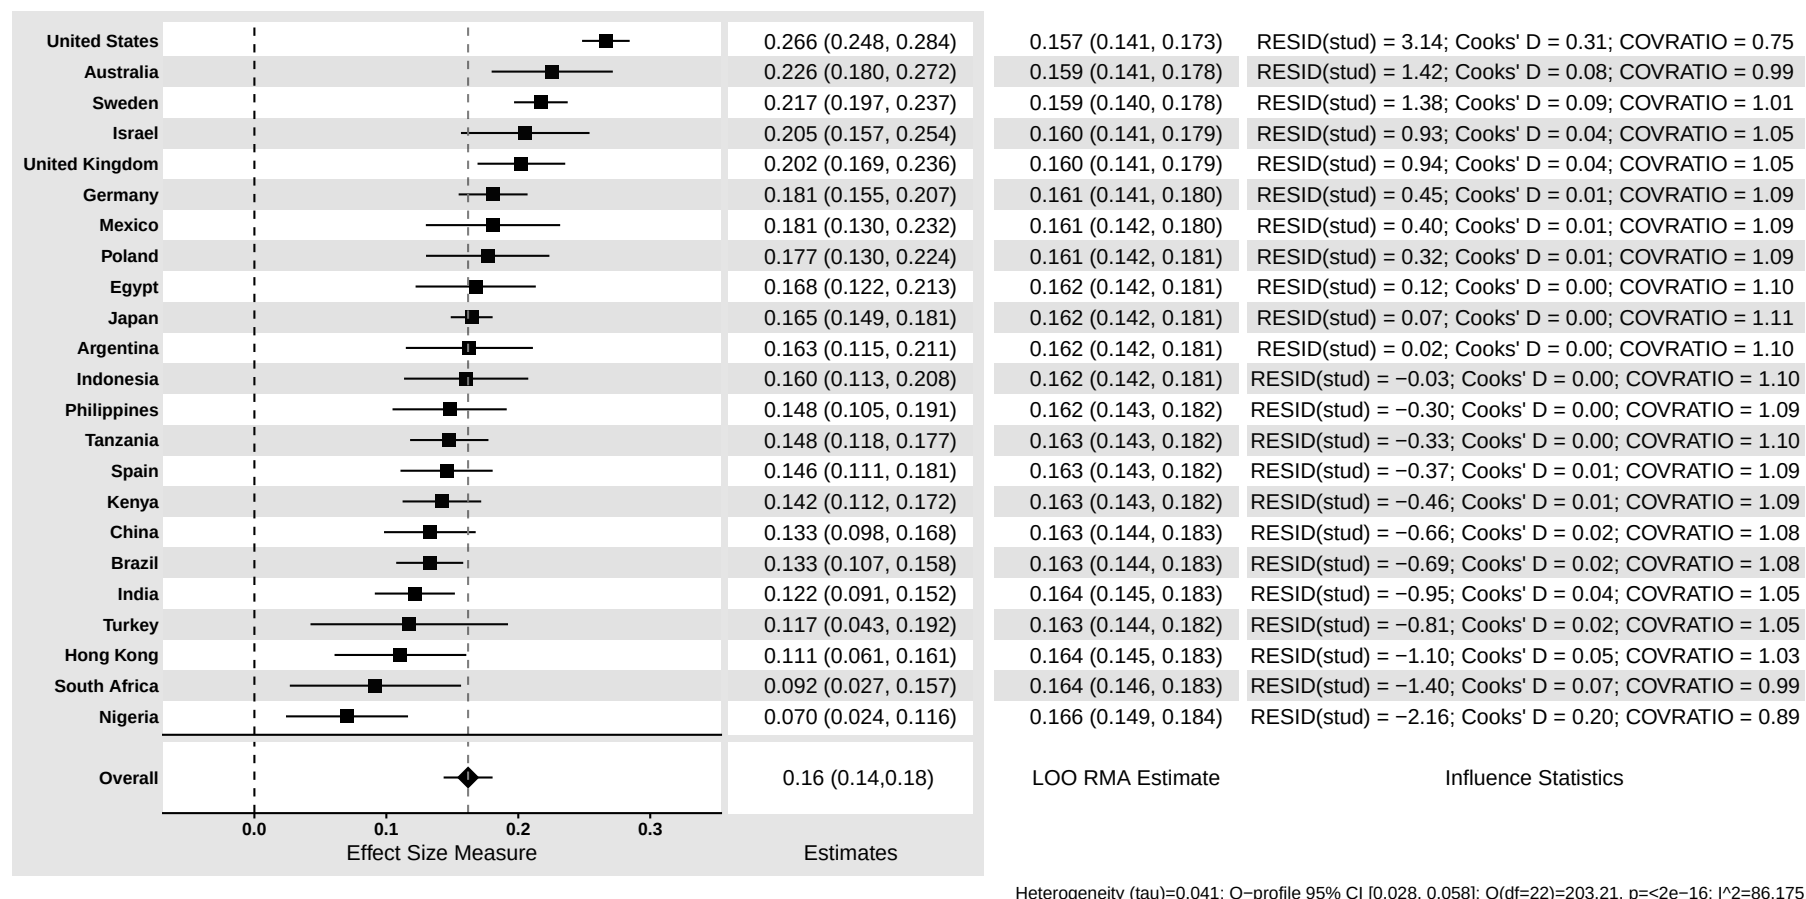

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S11. Heterogeneity in the effects of optimism at Wave 2 on secure flourishing index at Wave 3 scores across countries.

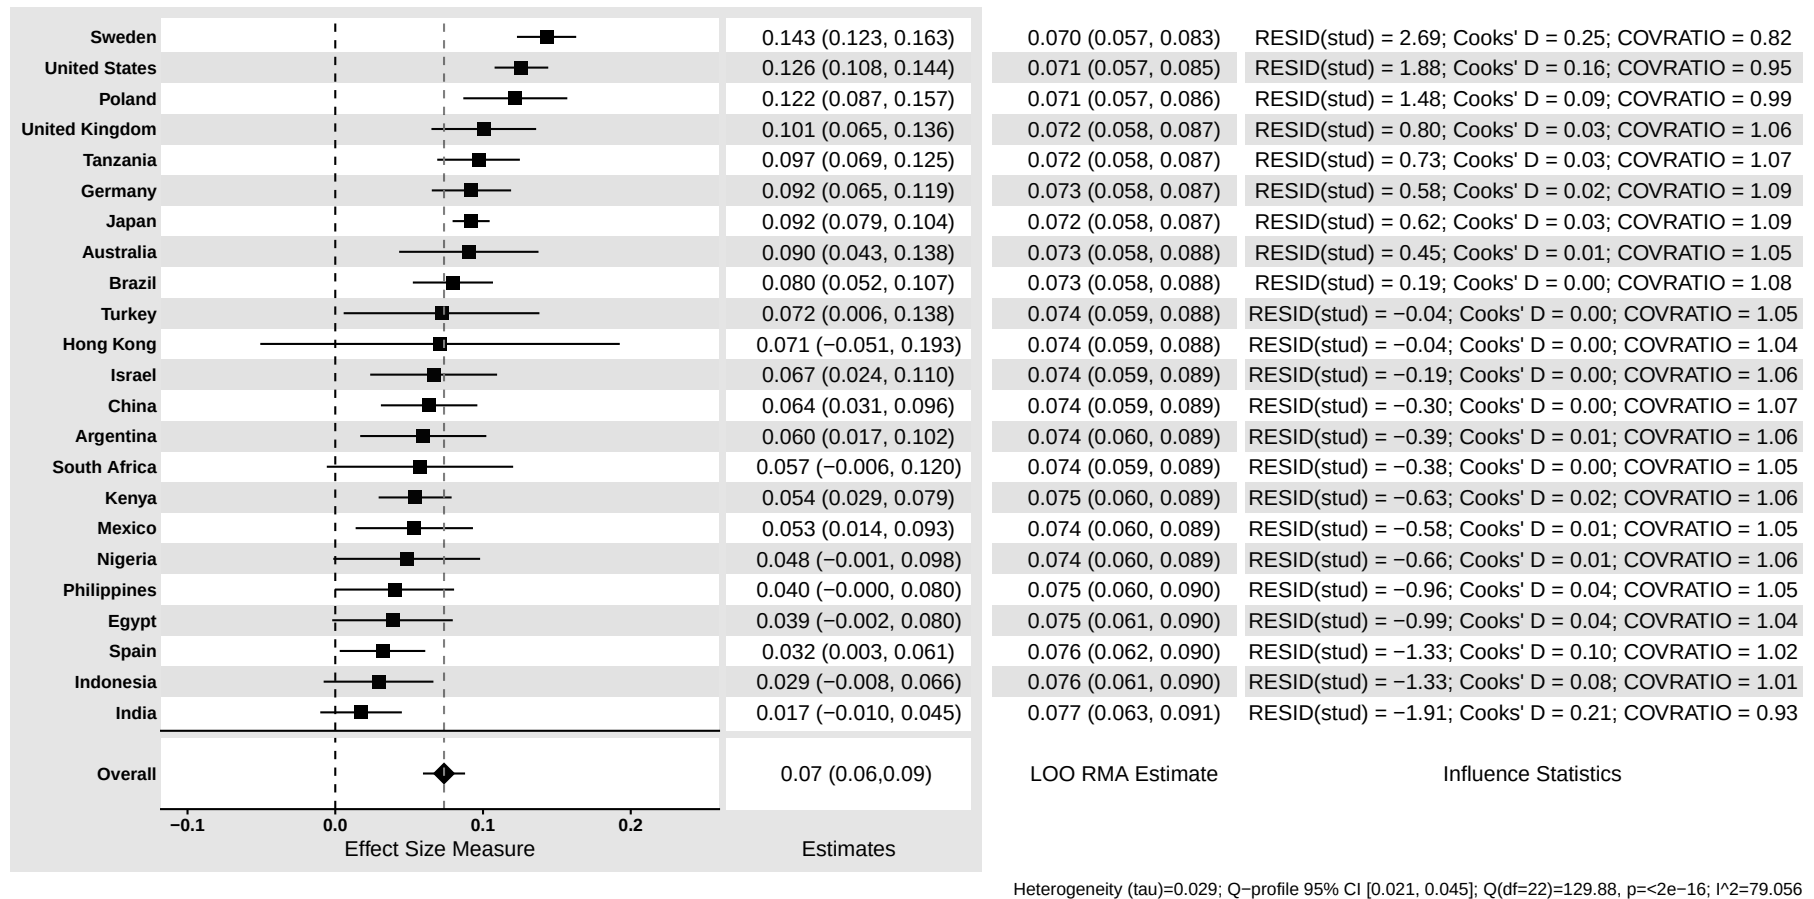

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S12. *Heterogeneity in the effects of freedom to pursue what's important at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

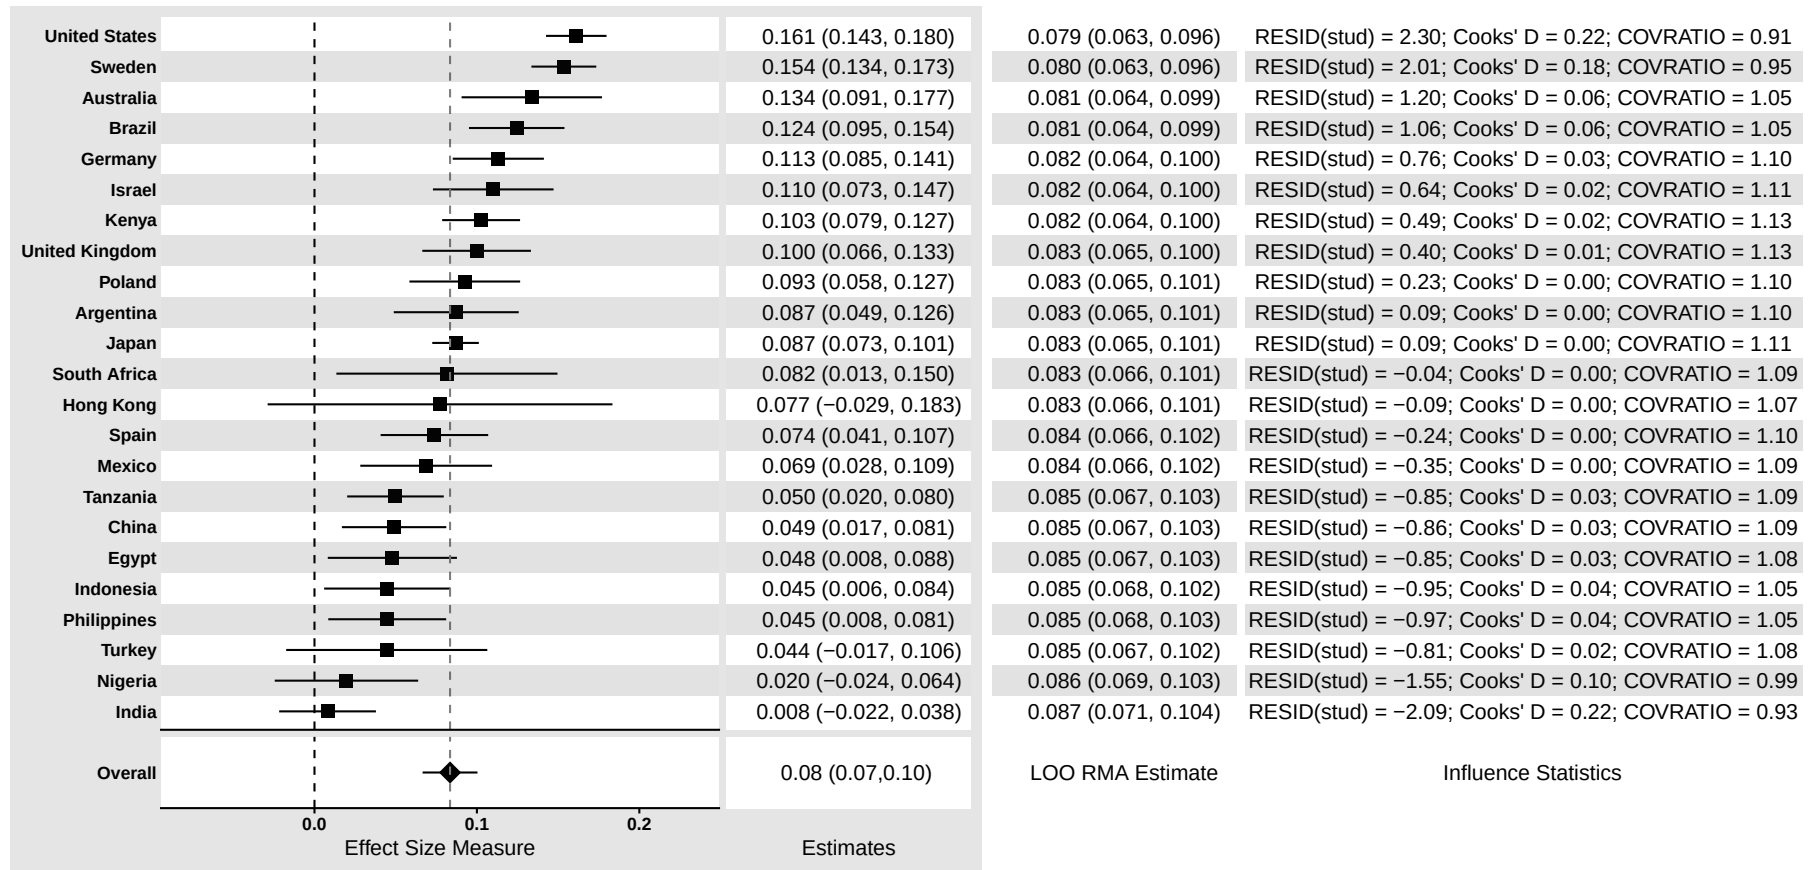

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S13. Heterogeneity in the effects of inner peace at Wave 2 on secure flourishing index at Wave 3 scores across countries.

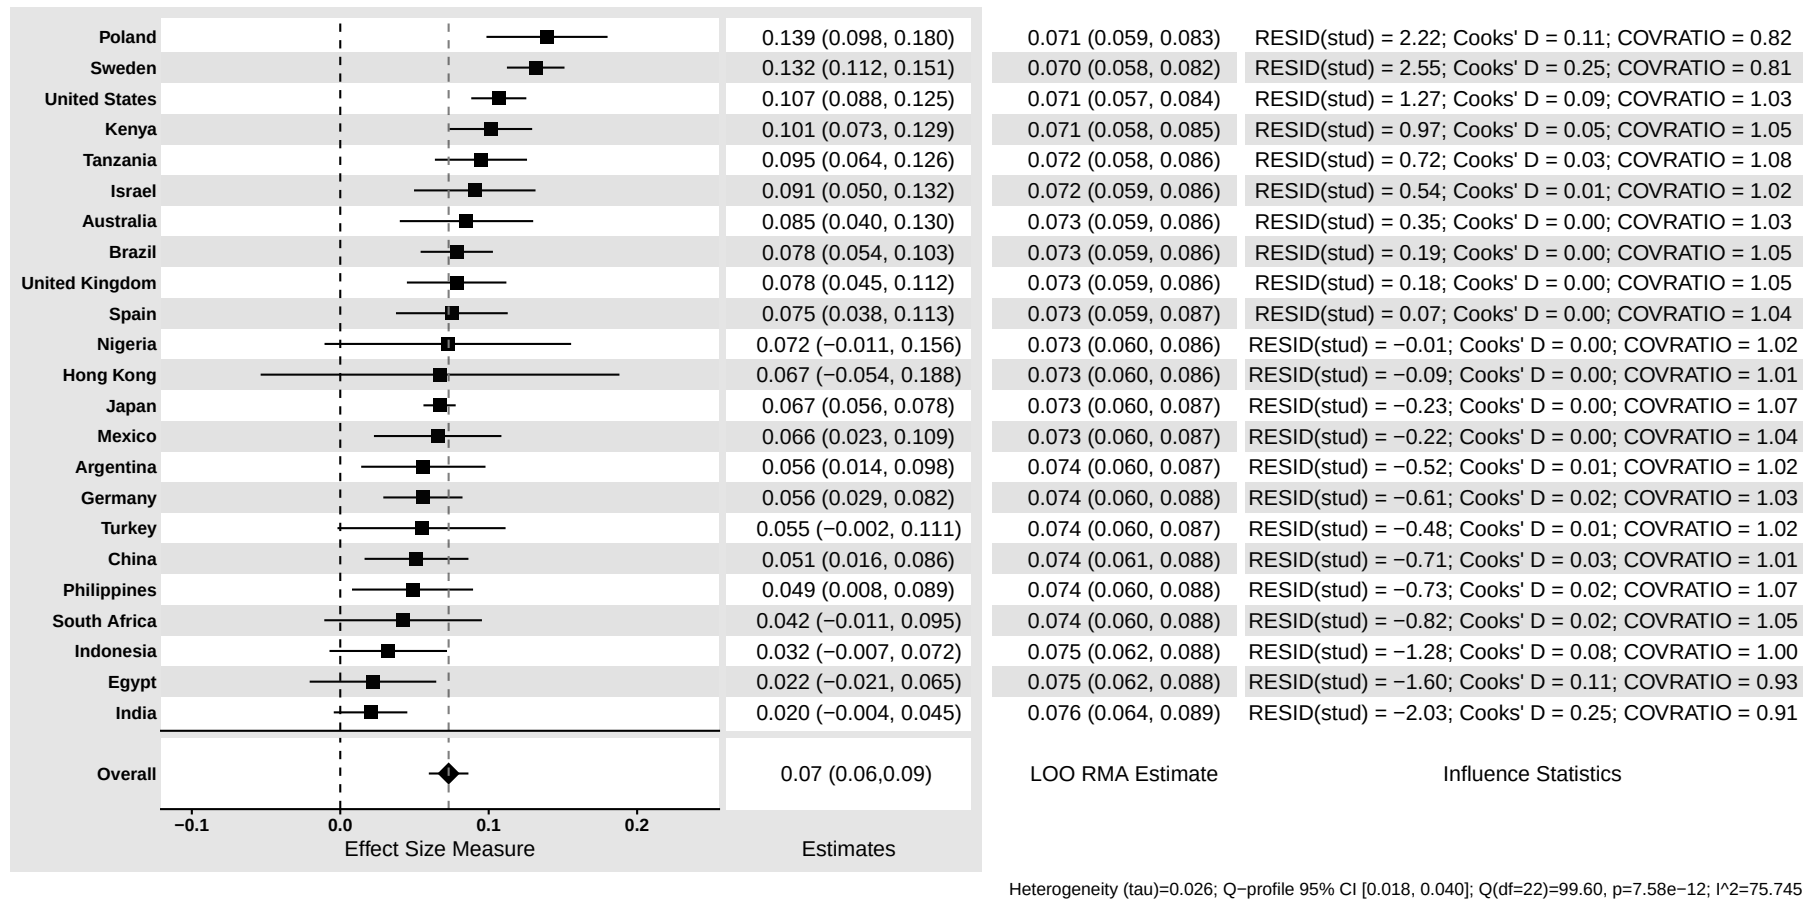

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S14. Heterogeneity in the effects of life balance at Wave 2 on secure flourishing index at Wave 3 scores across countries.

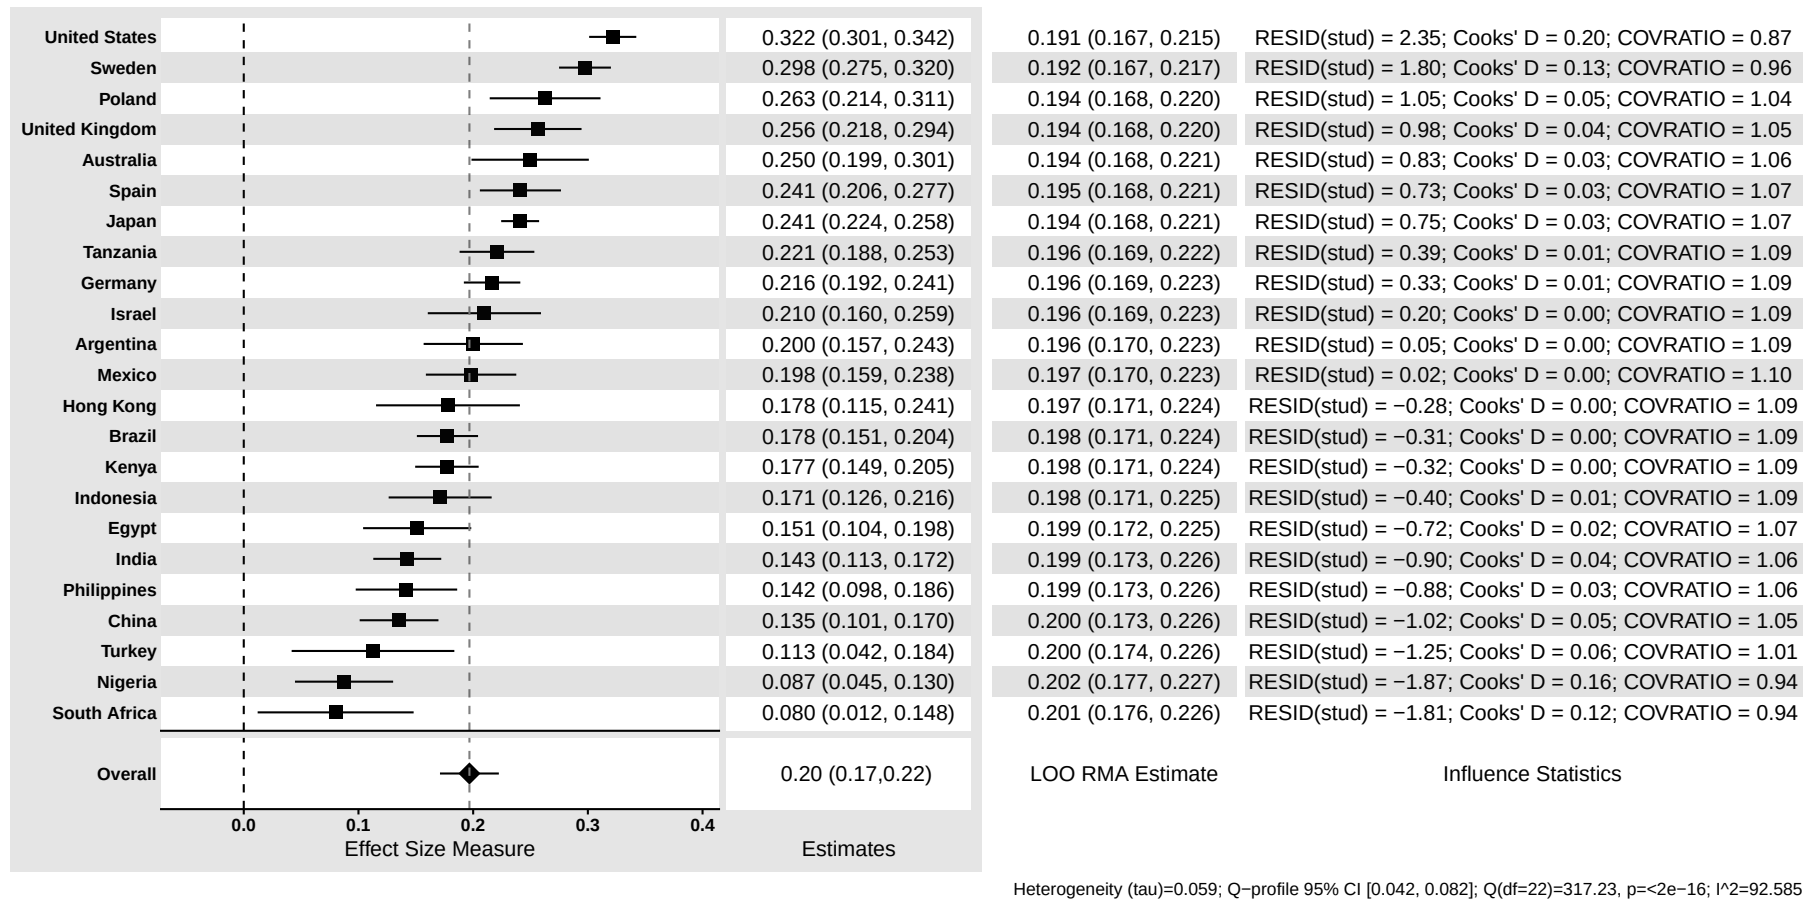

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S15. Heterogeneity in the effects of sense of mastery at Wave 2 on secure flourishing index at Wave 3 scores across countries.

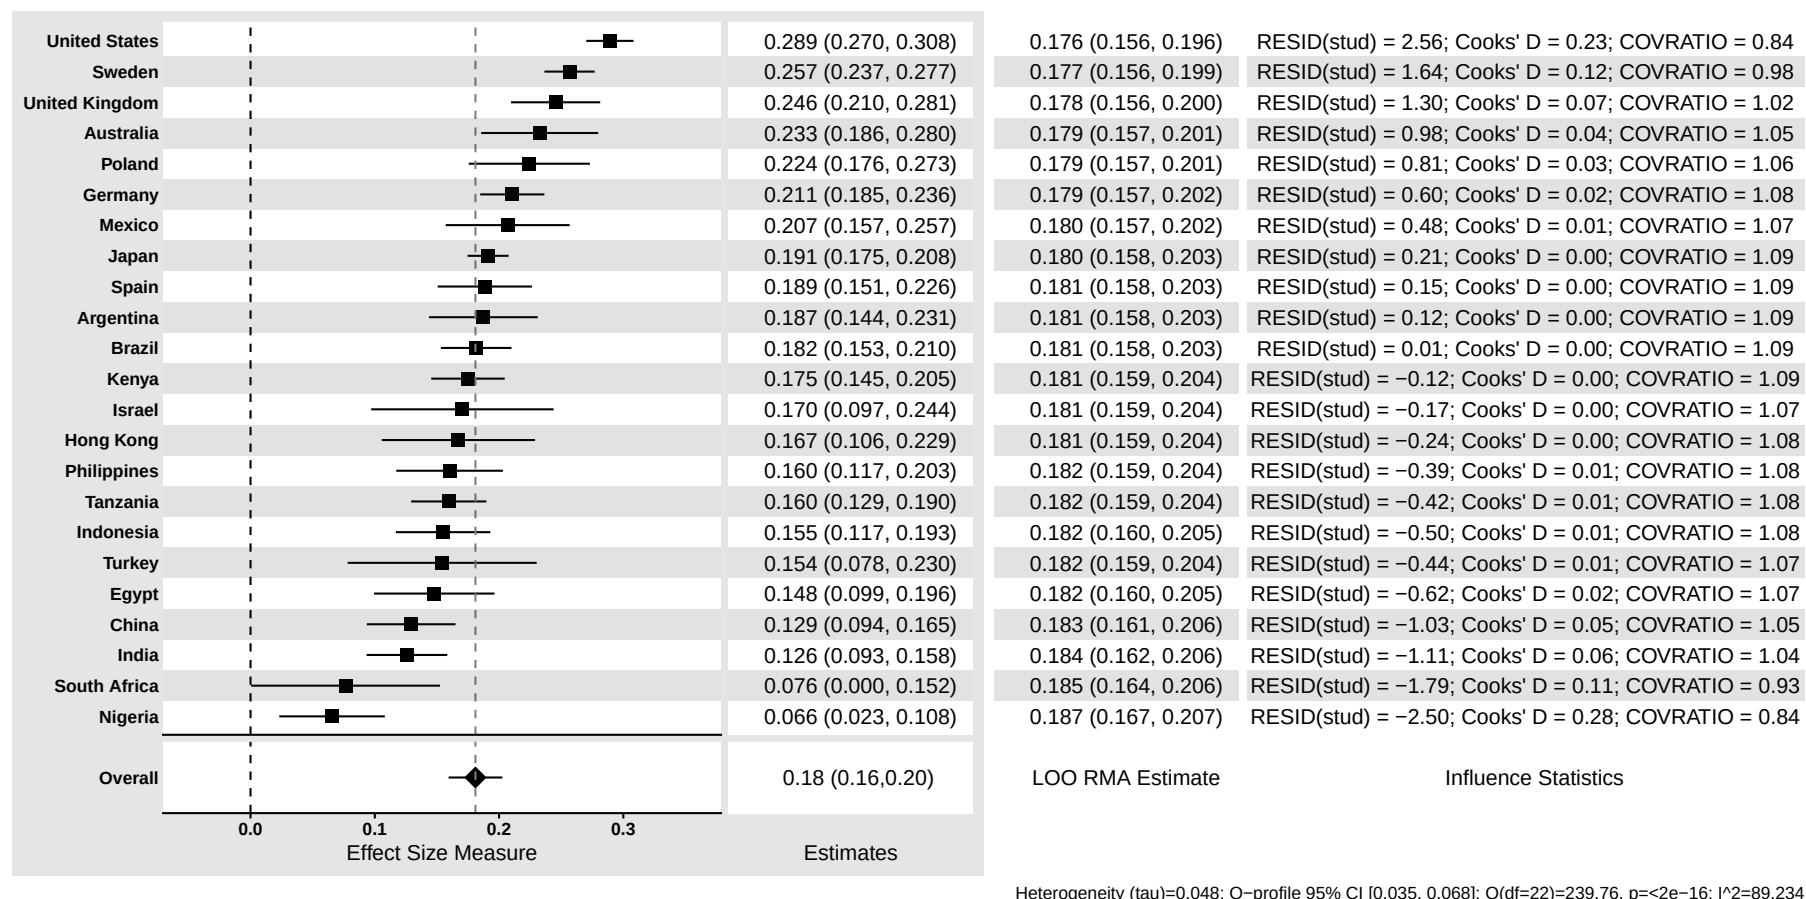

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S16. Heterogeneity in the effects of meaningful activities at Wave 2 on secure flourishing index at Wave 3 scores across countries.

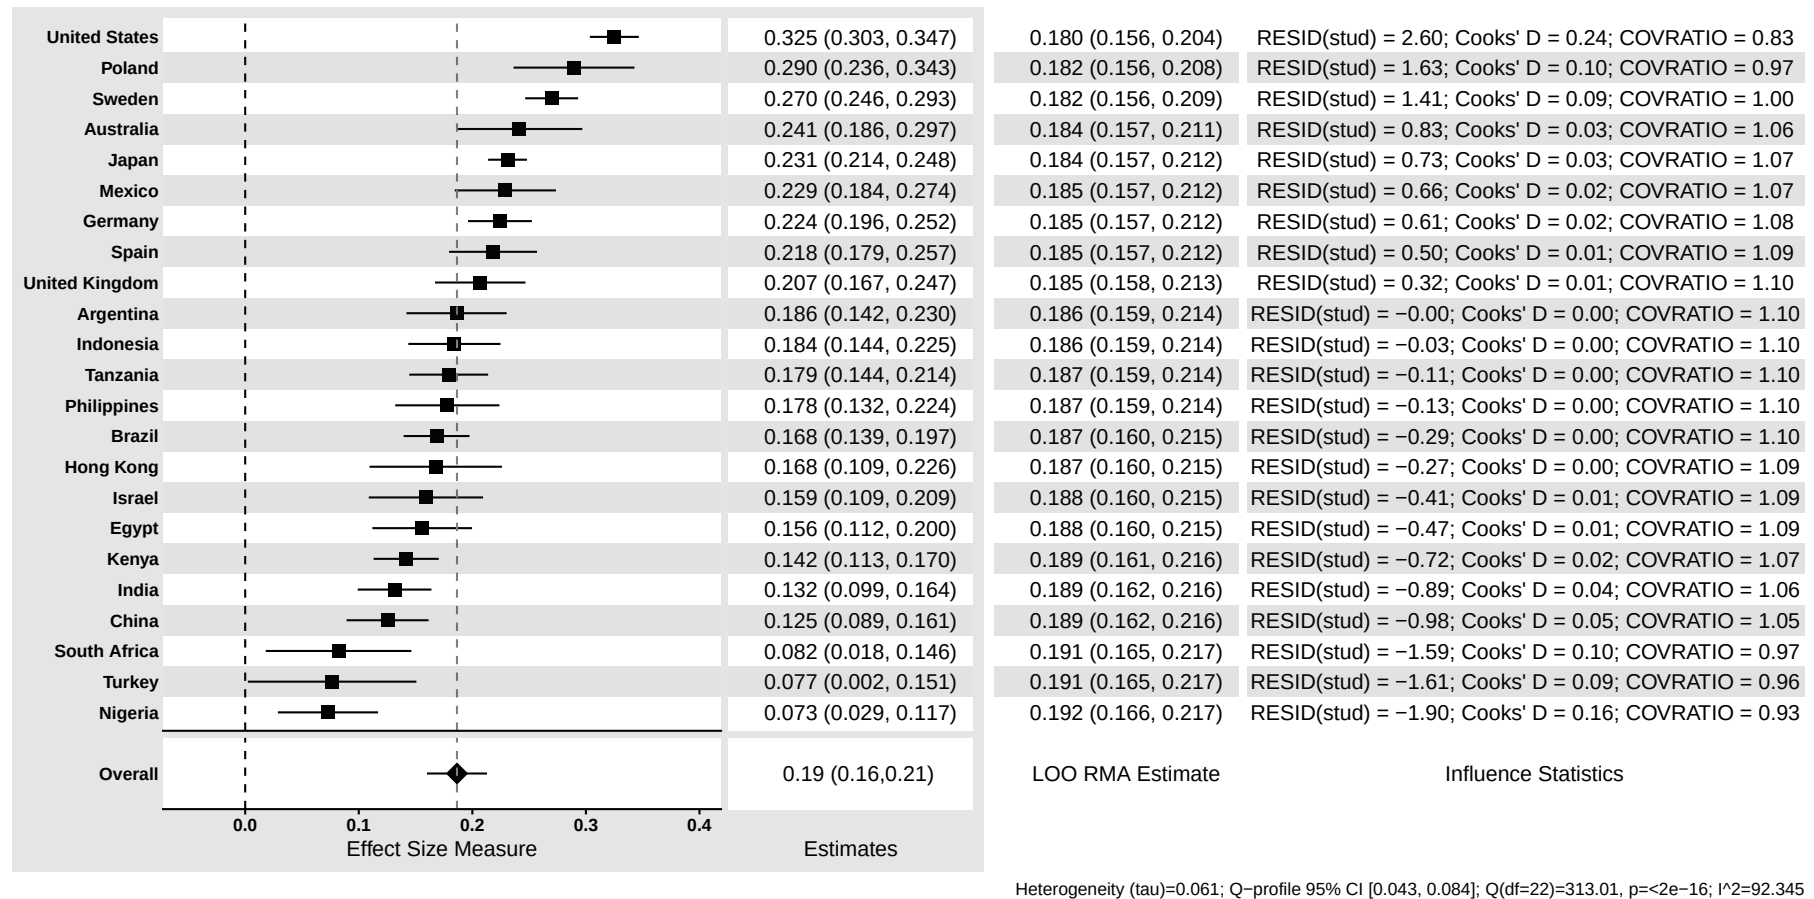

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S17. Heterogeneity in the effects of understanding purpose at Wave 2 on secure flourishing index at Wave 3 scores across countries.

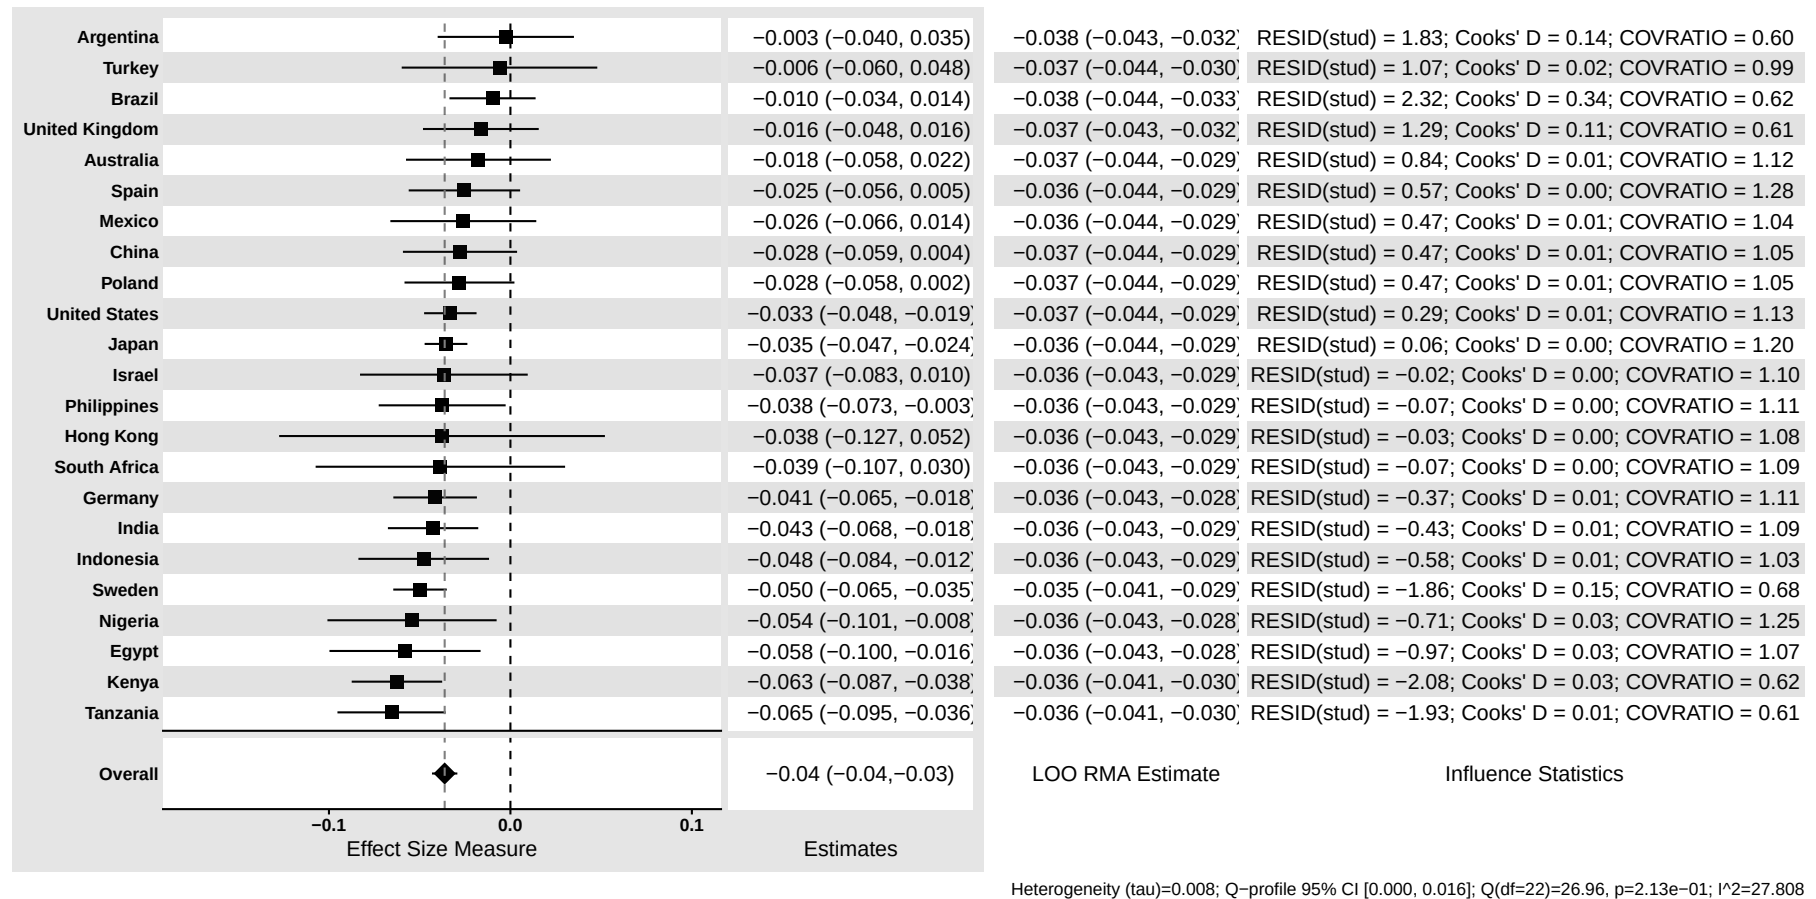

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S18. Heterogeneity in the effects of self-rated mental health at Wave 2 on secure flourishing index at Wave 3 scores across countries.

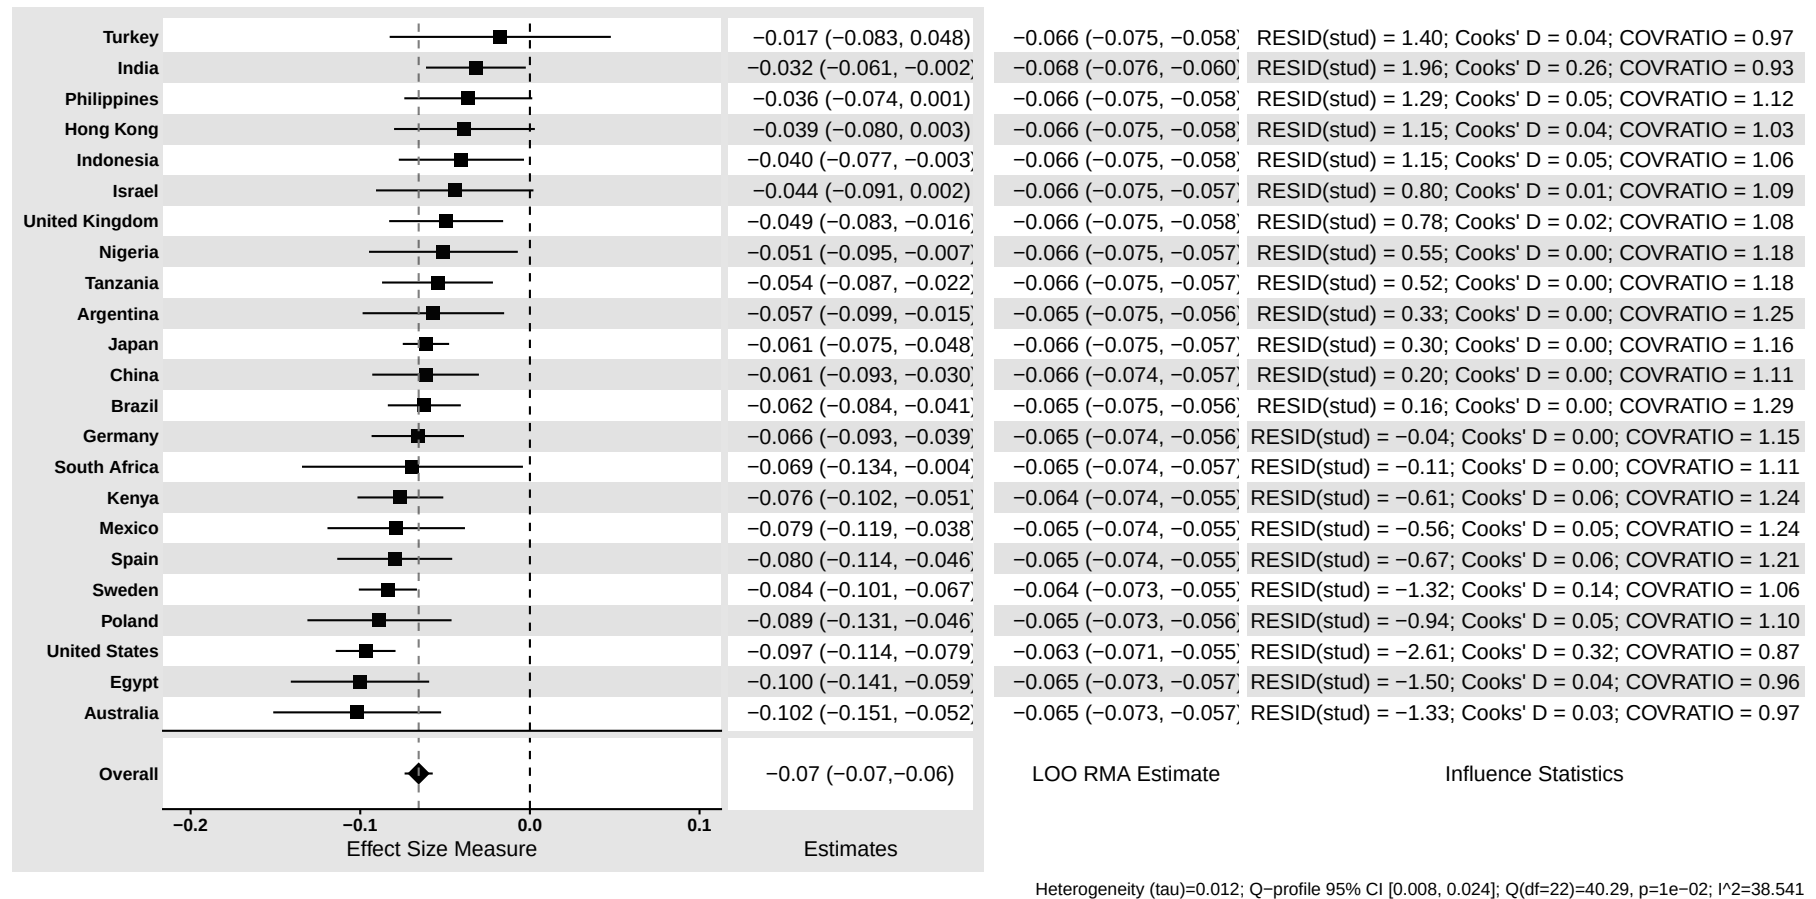

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S19. Heterogeneity in the effects of traumatic distress at Wave 2 on secure flourishing index at Wave 3 scores across countries.

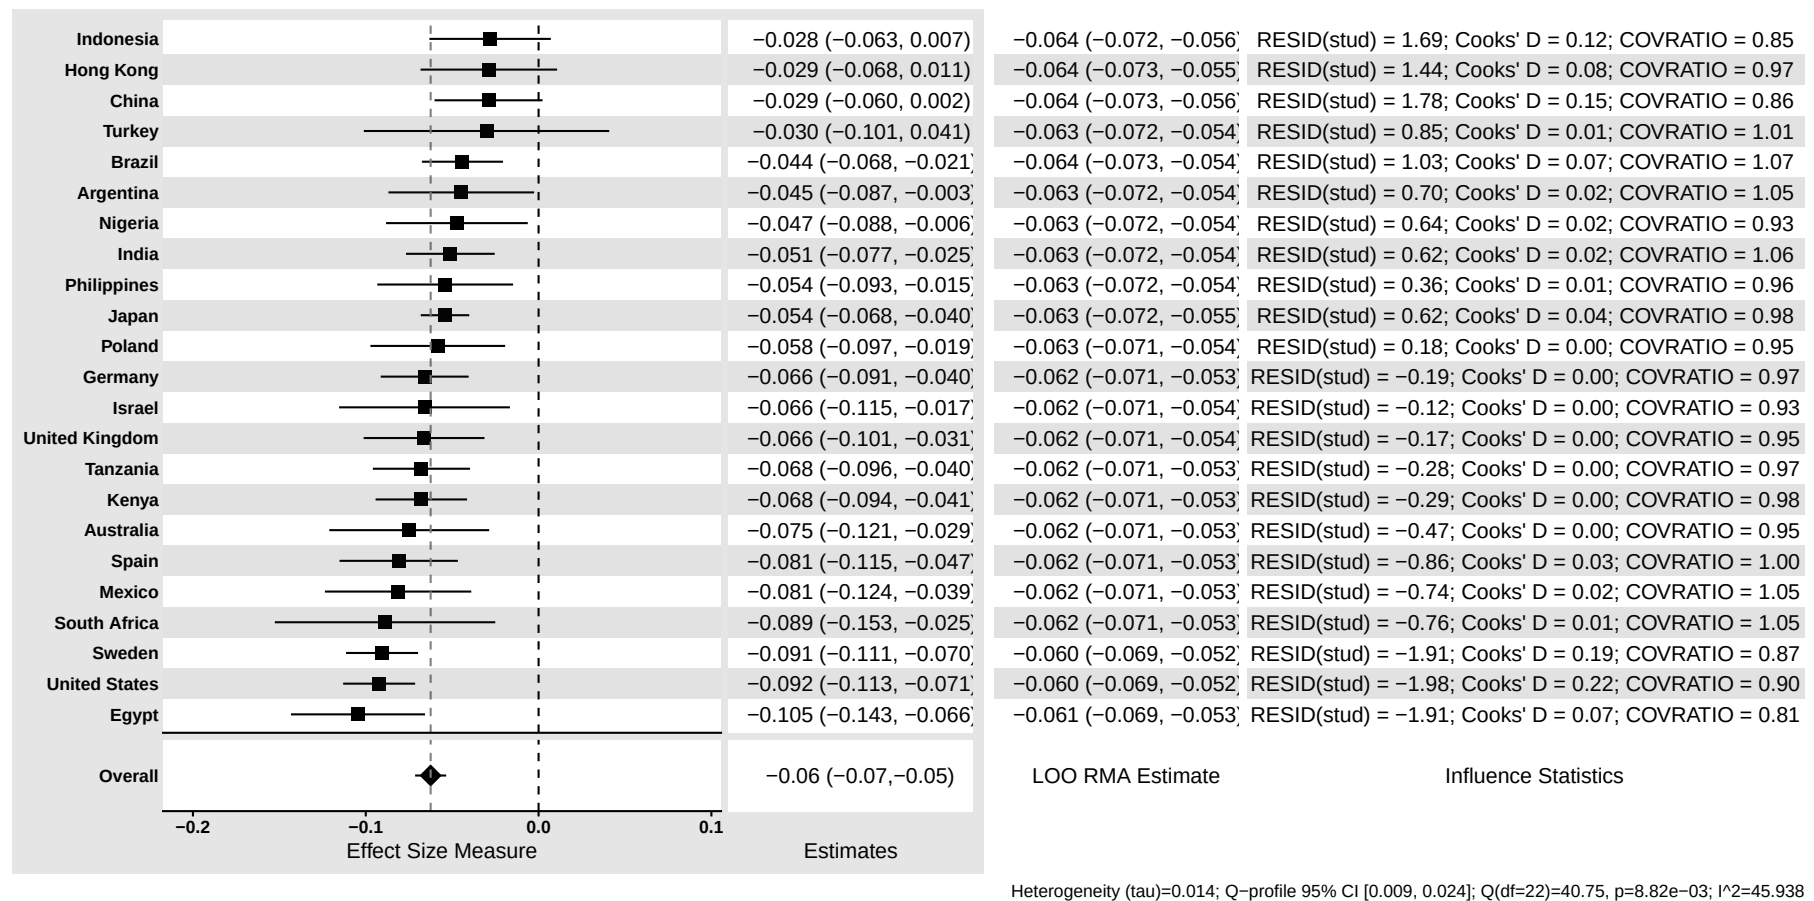

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S20. Heterogeneity in the effects of depression symptoms composite at Wave 2 on secure flourishing index at Wave 3 scores across countries.

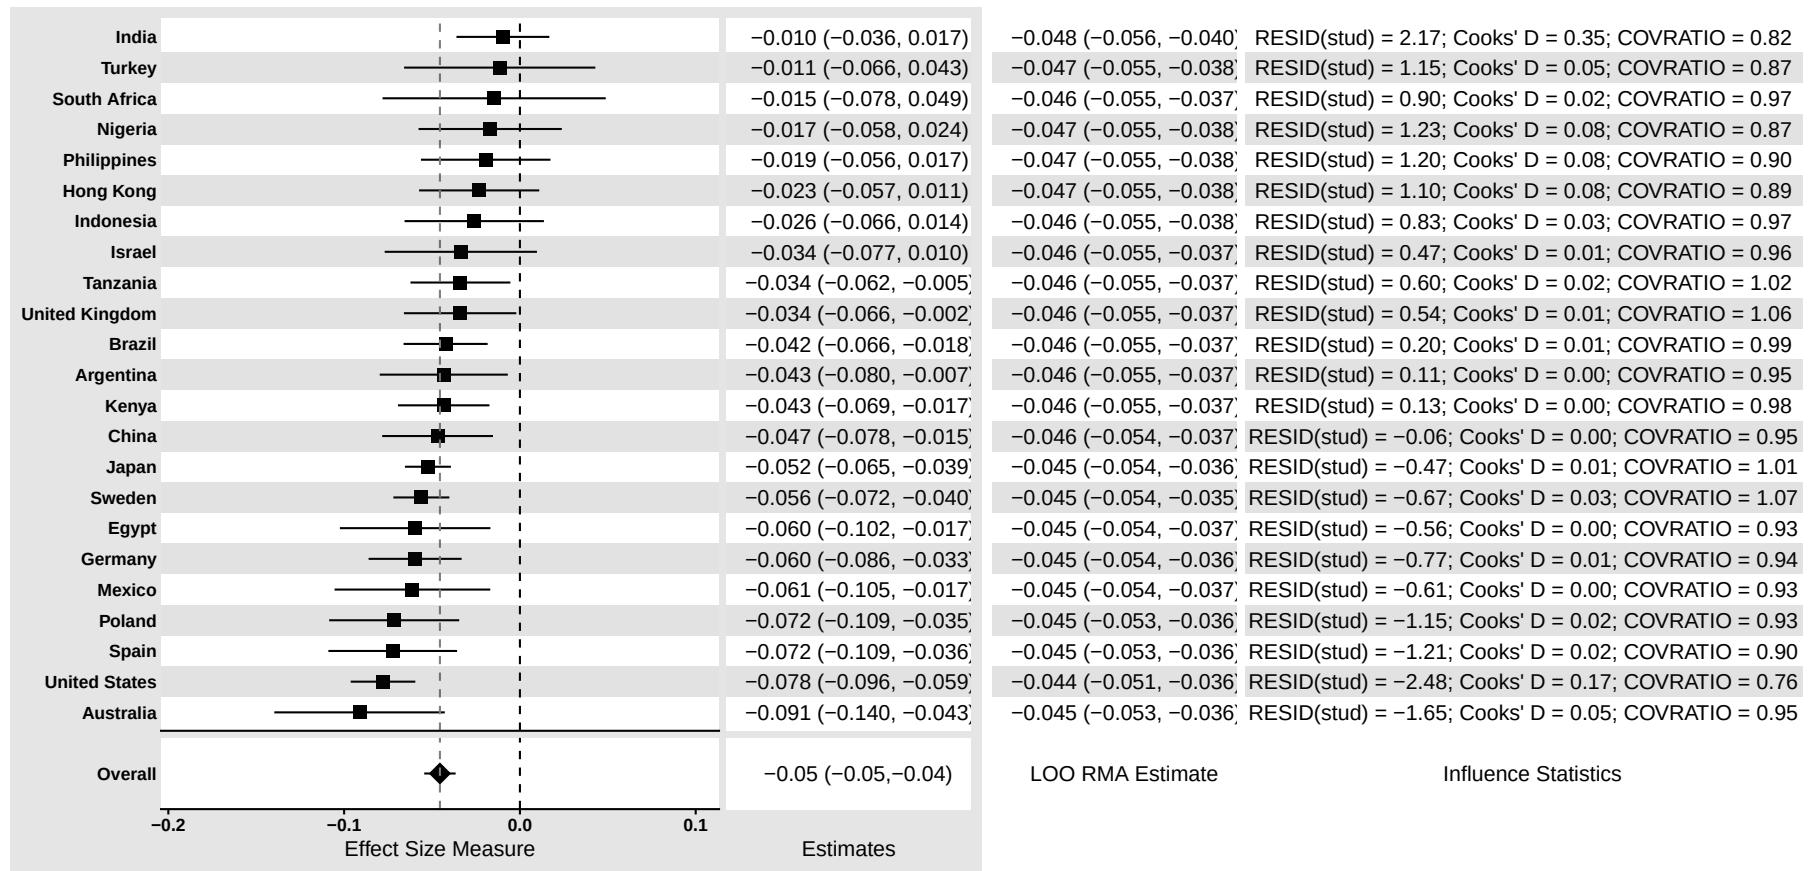

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S21. Heterogeneity in the effects of depression – feel hopeless at Wave 2 on secure flourishing index at Wave 3 scores across countries.

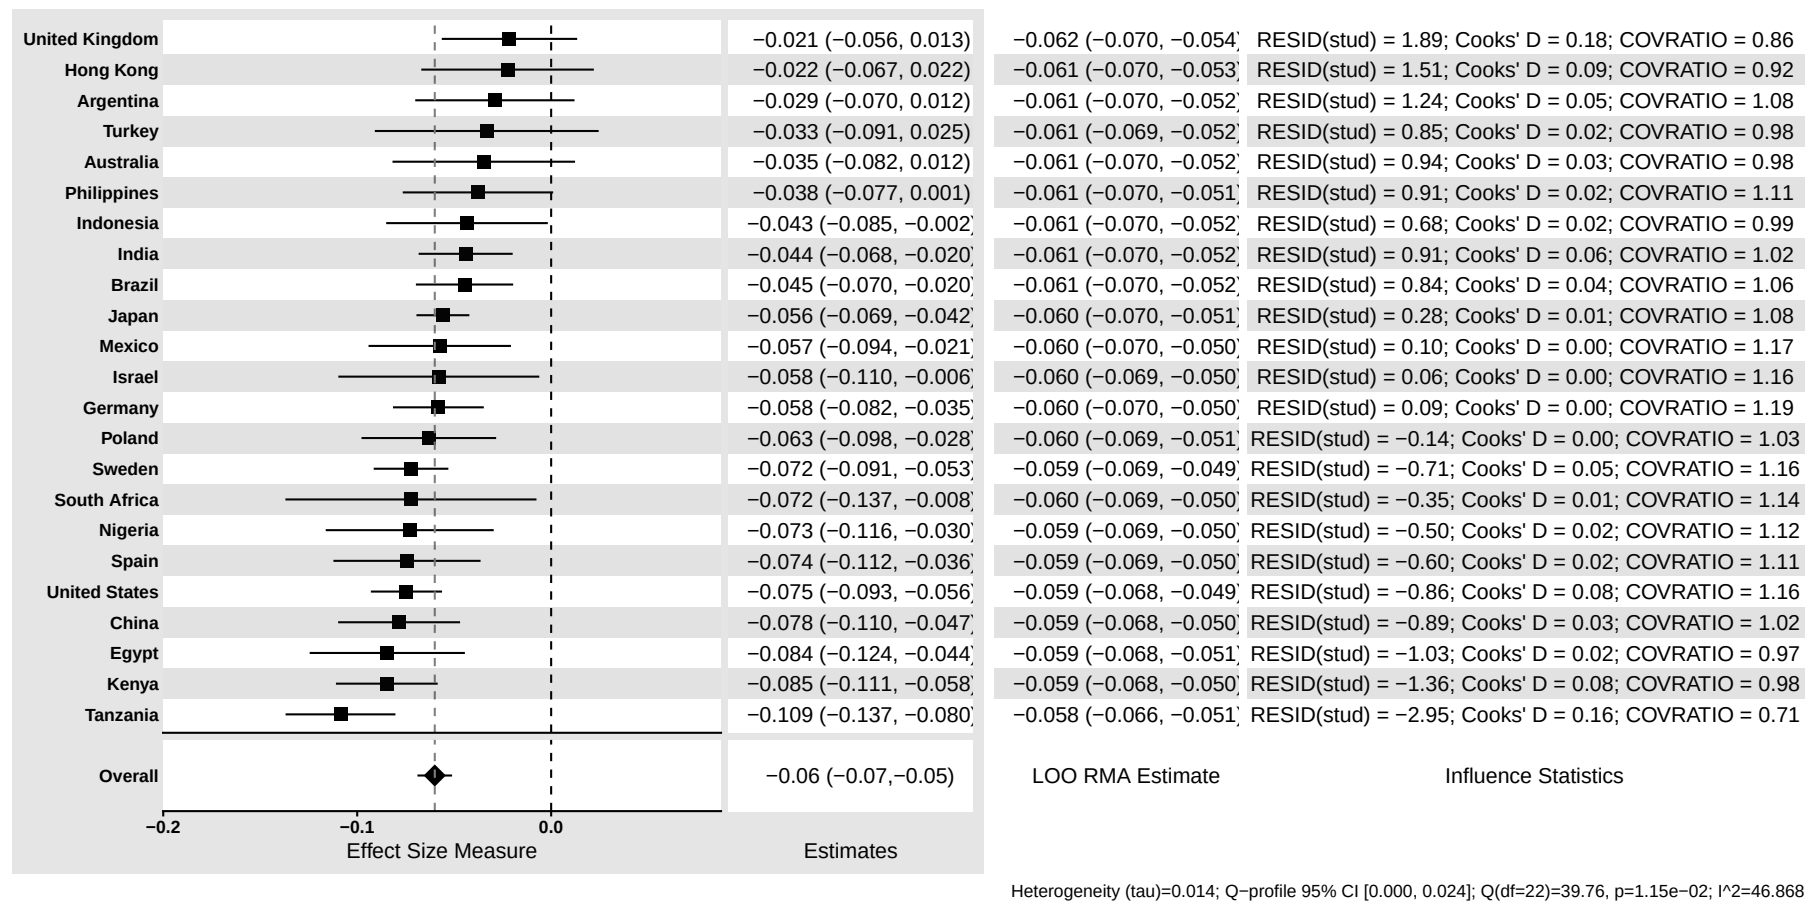

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cook's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S22. Heterogeneity in the effects of depression – loss of interest at Wave 2 on secure flourishing index at Wave 3 scores across countries.

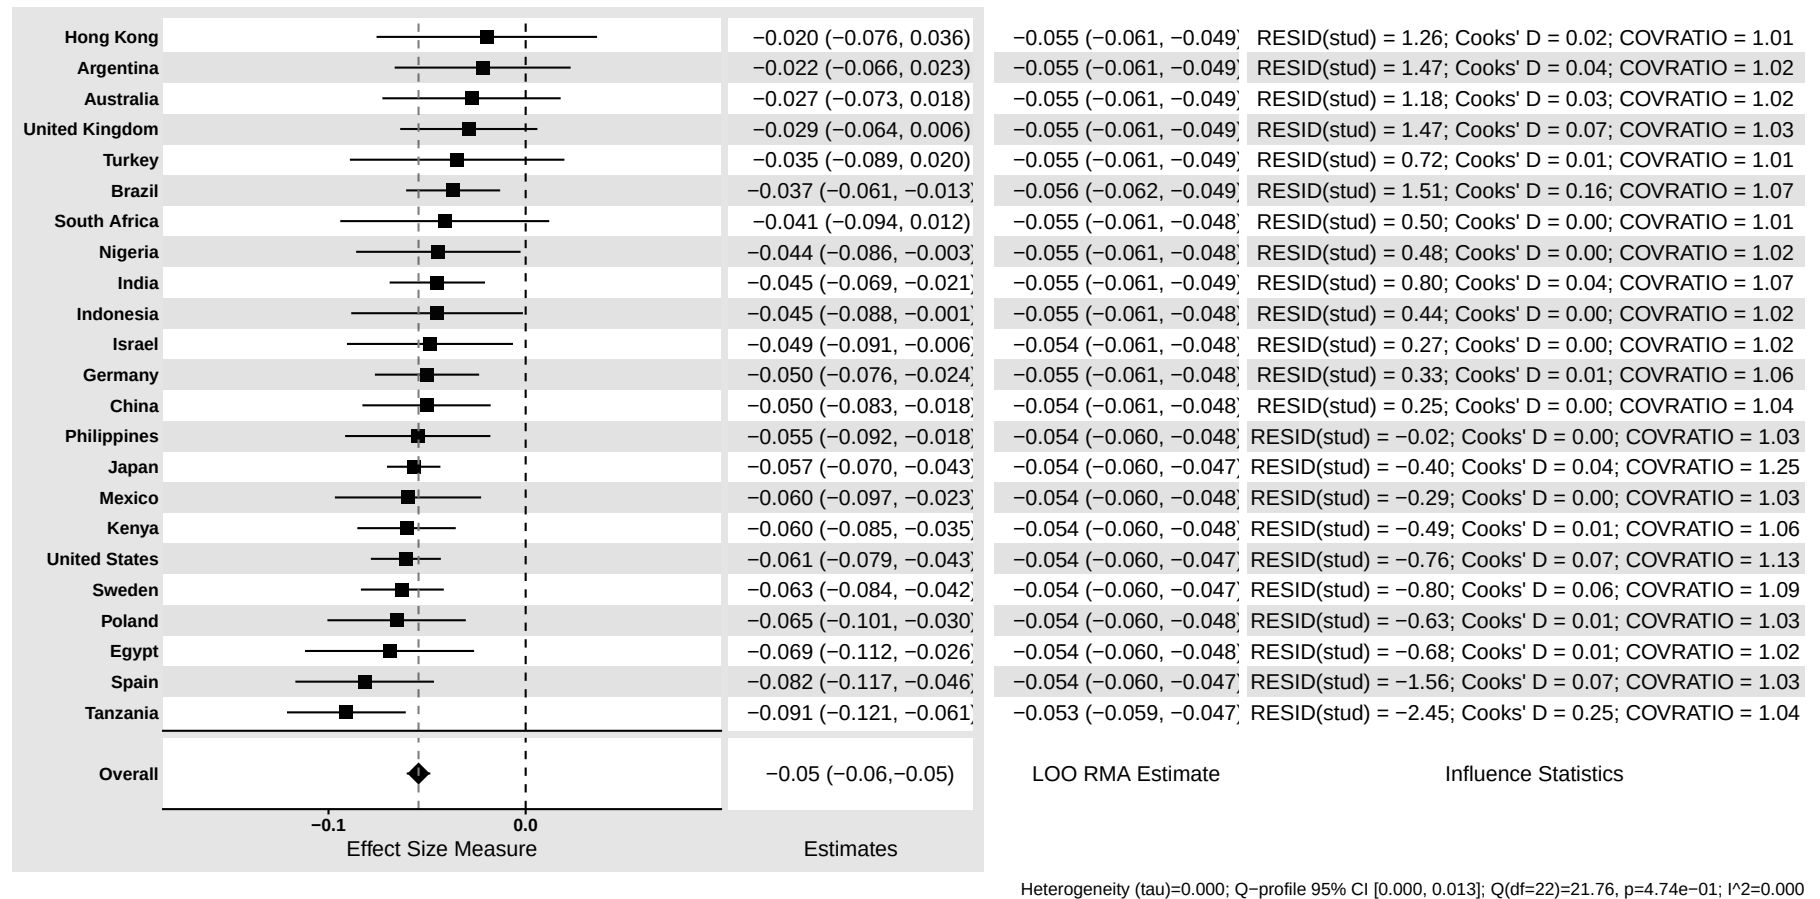

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S23. Heterogeneity in the effects of anxiety symptoms composite at Wave 2 on secure flourishing index at Wave 3 scores across countries.

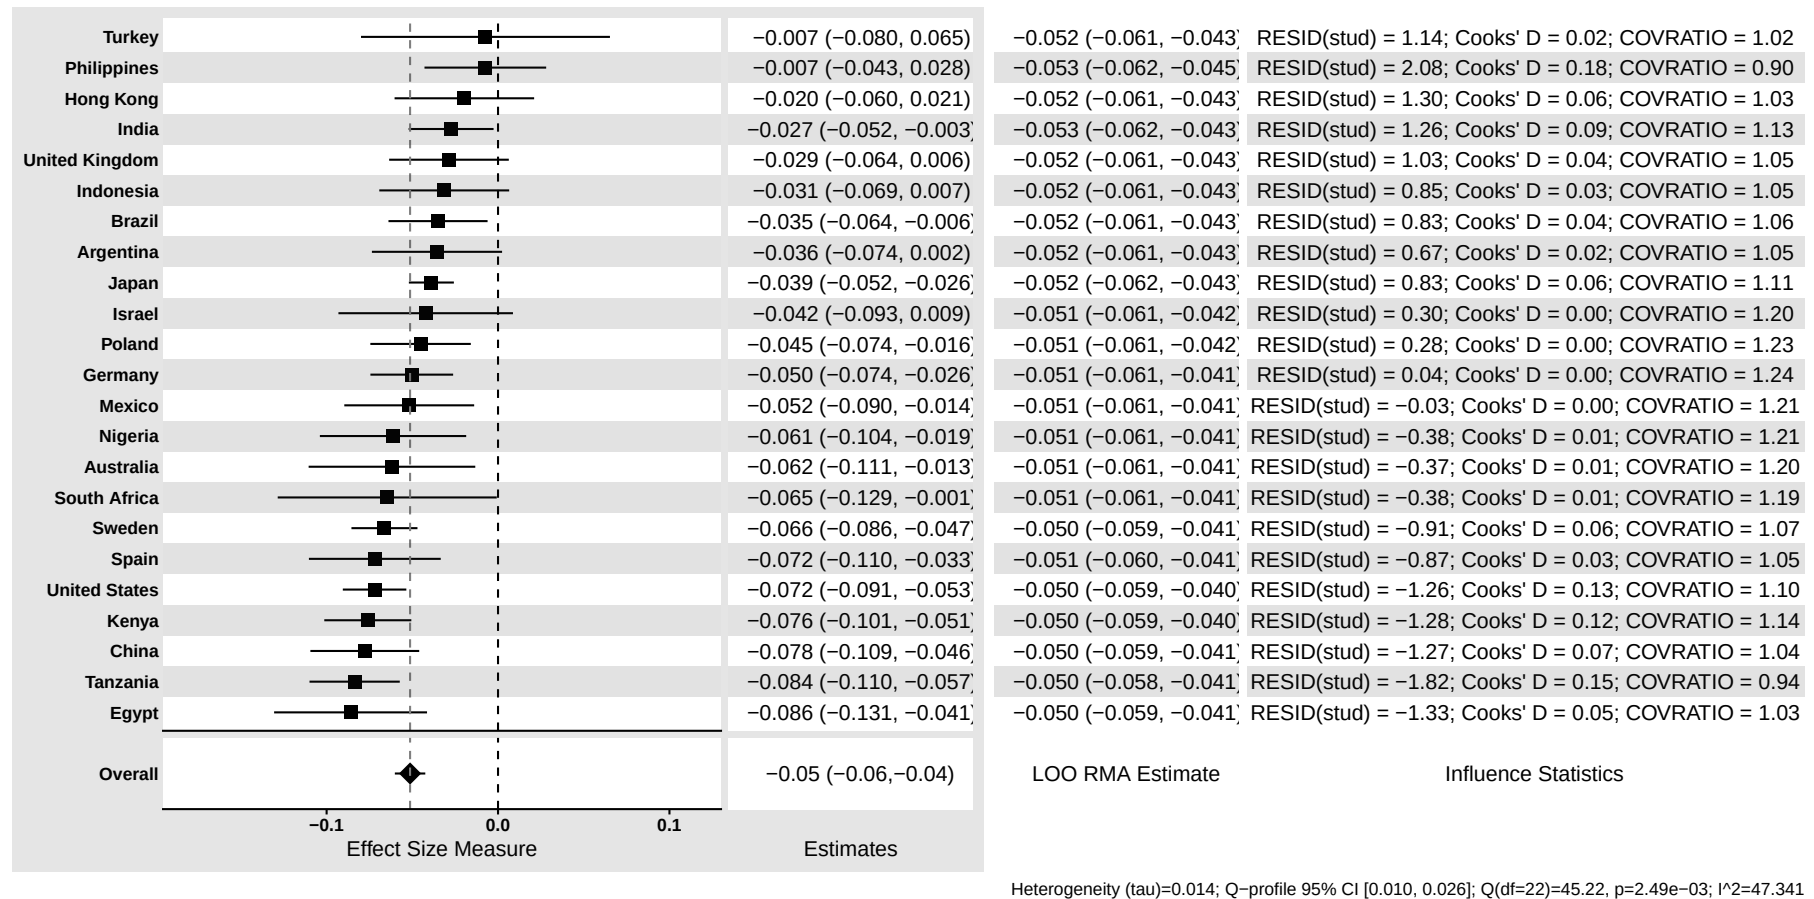

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S24. Heterogeneity in the effects of anxiety – feel on edge at Wave 2 on secure flourishing index at Wave 3 scores across countries.

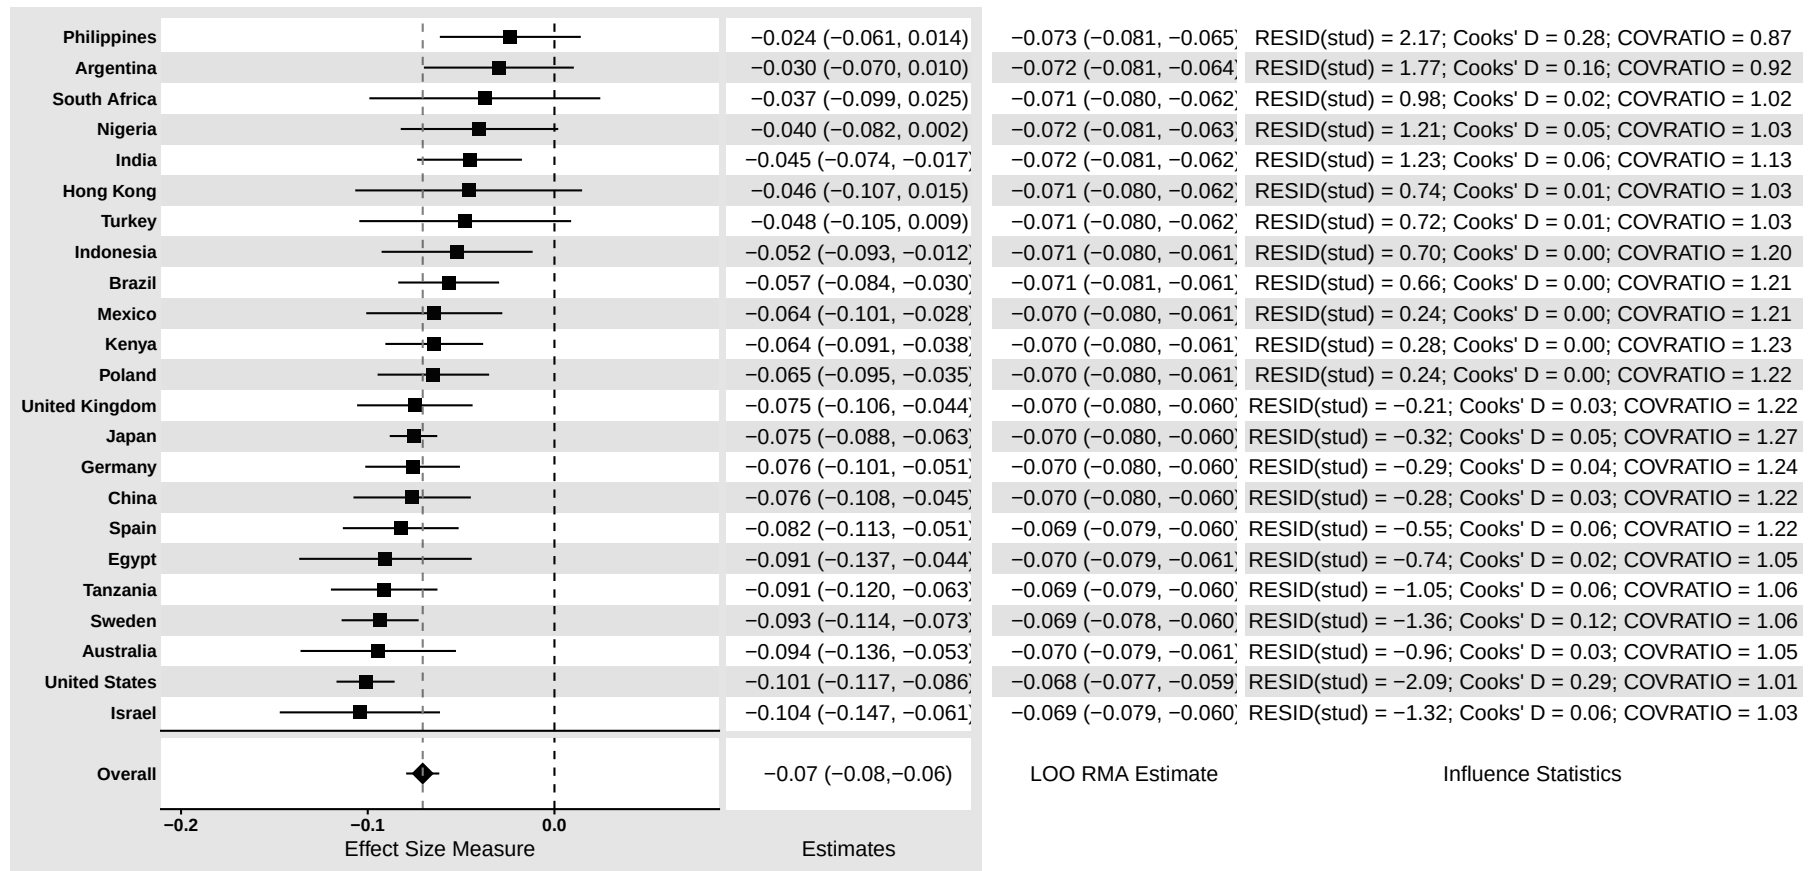

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S25. *Heterogeneity in the effects of anxiety – cannot stop worrying at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

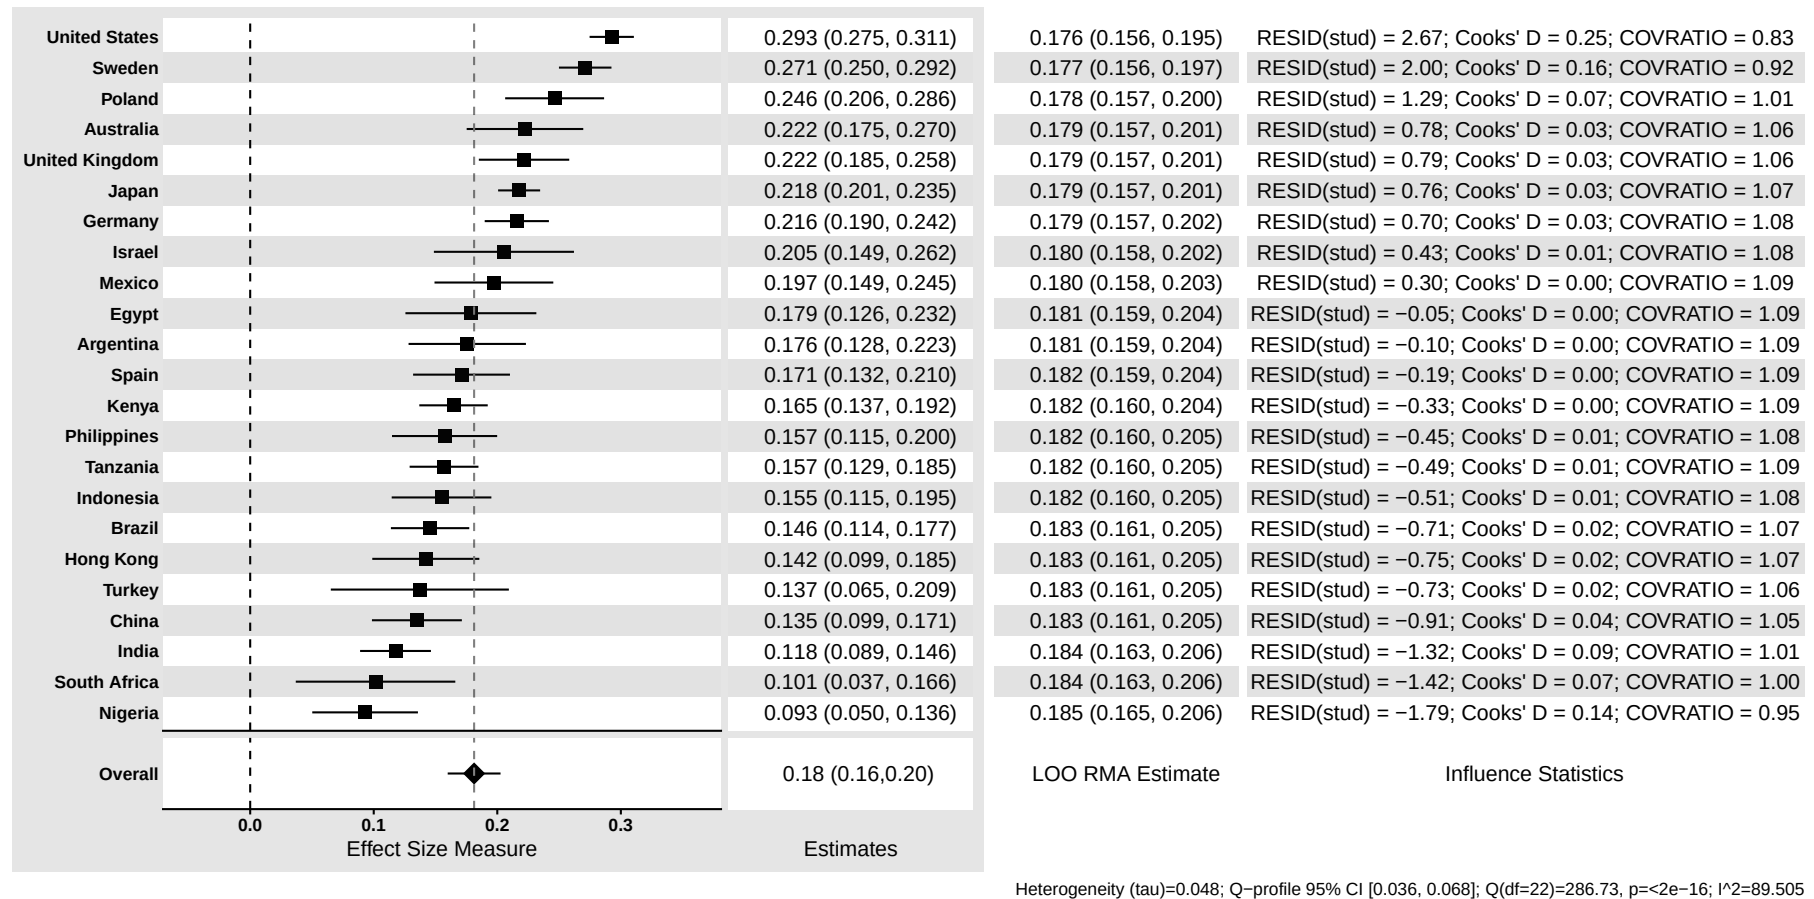

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S26. Heterogeneity in the effects of suffering at Wave 2 on secure flourishing index at Wave 3 scores across countries.

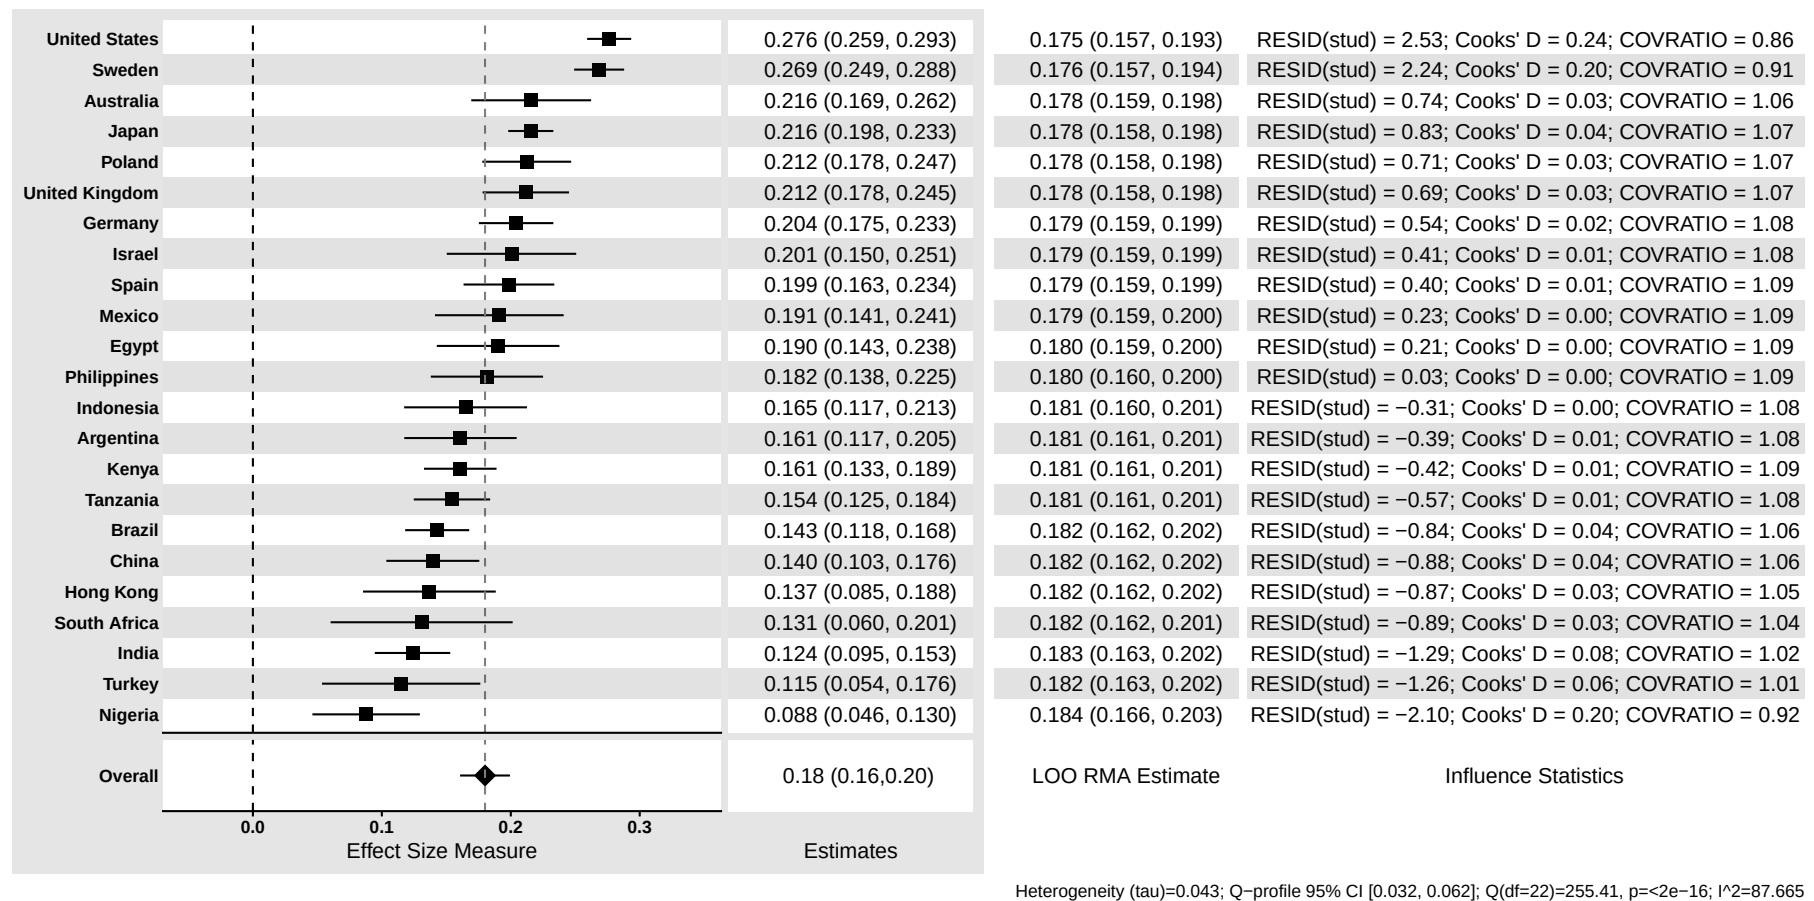

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S27. Heterogeneity in the effects of relationship contentment at Wave 2 on secure flourishing index at Wave 3 scores across countries.

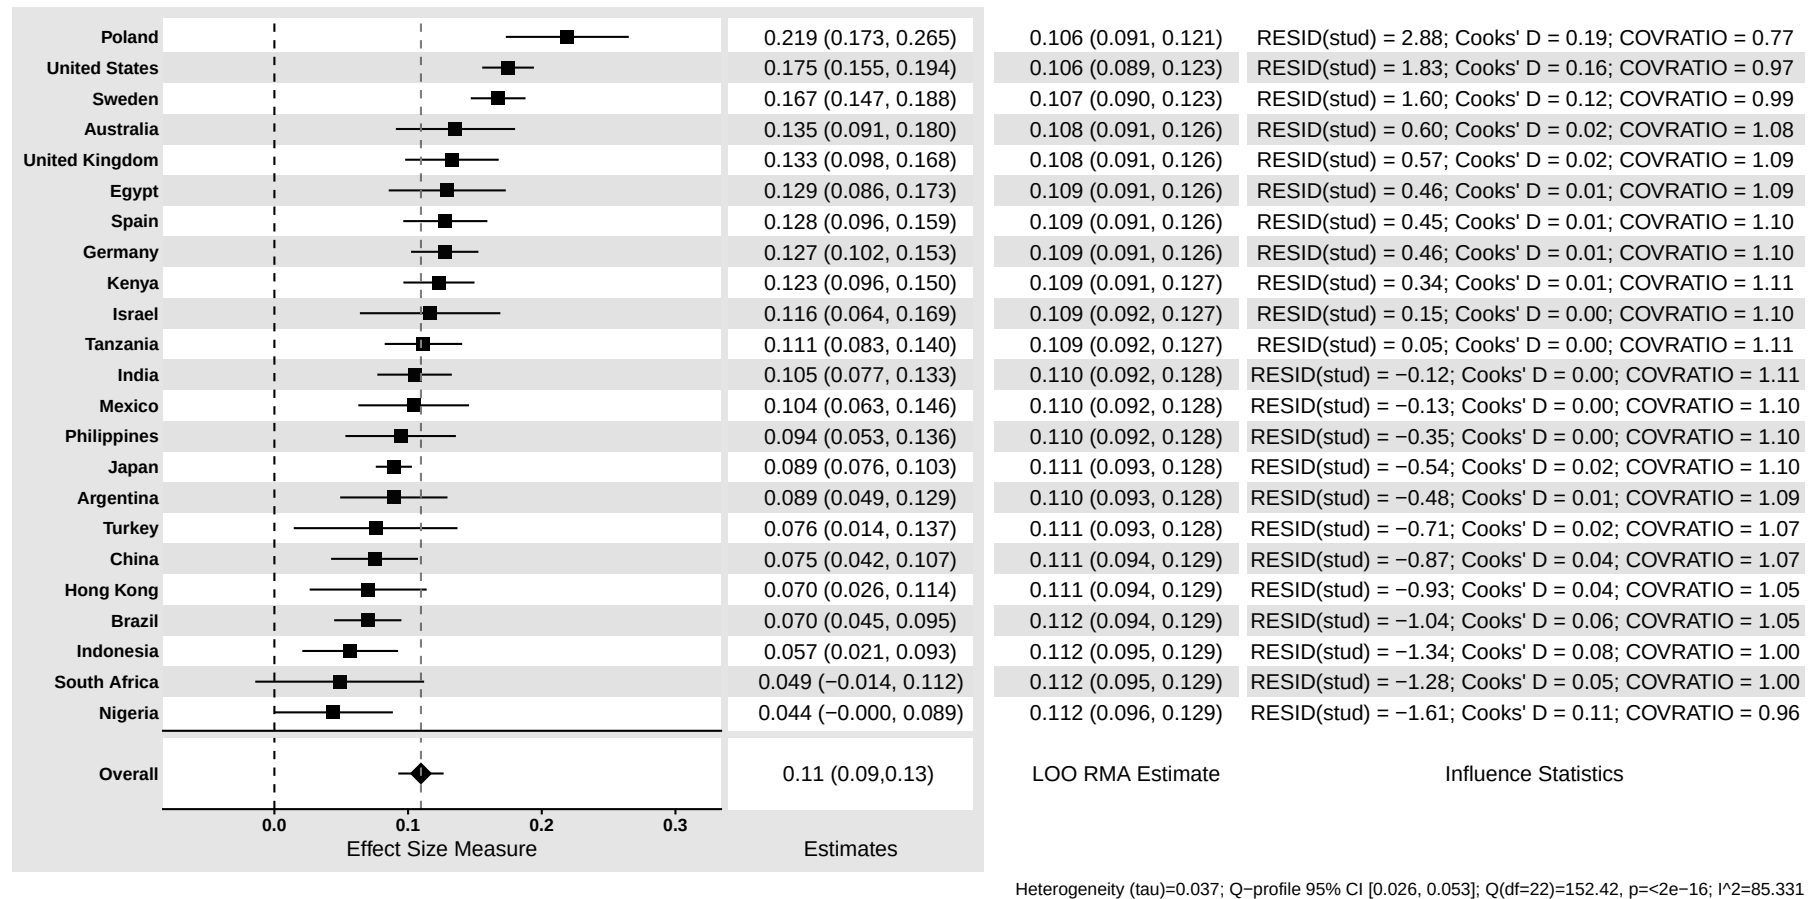

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S28. Heterogeneity in the effects of relationship satisfaction at Wave 2 on secure flourishing index at Wave 3 scores across countries.

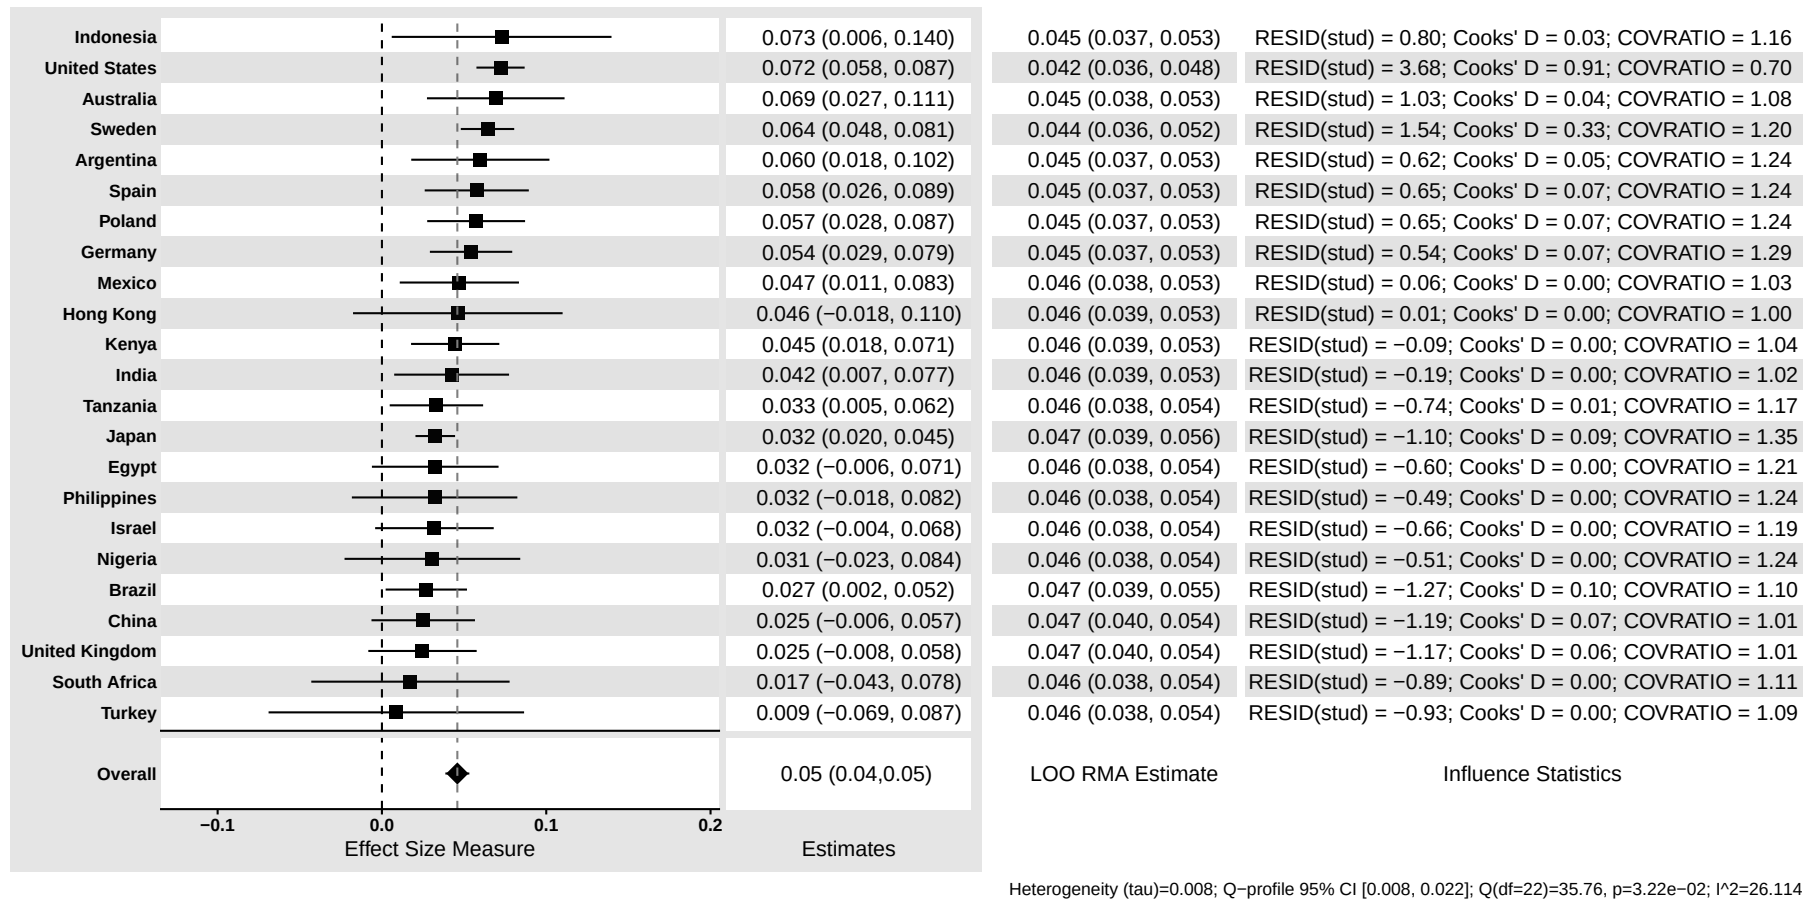

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S29. Heterogeneity in the effects of social support at Wave 2 on secure flourishing index at Wave 3 scores across countries.

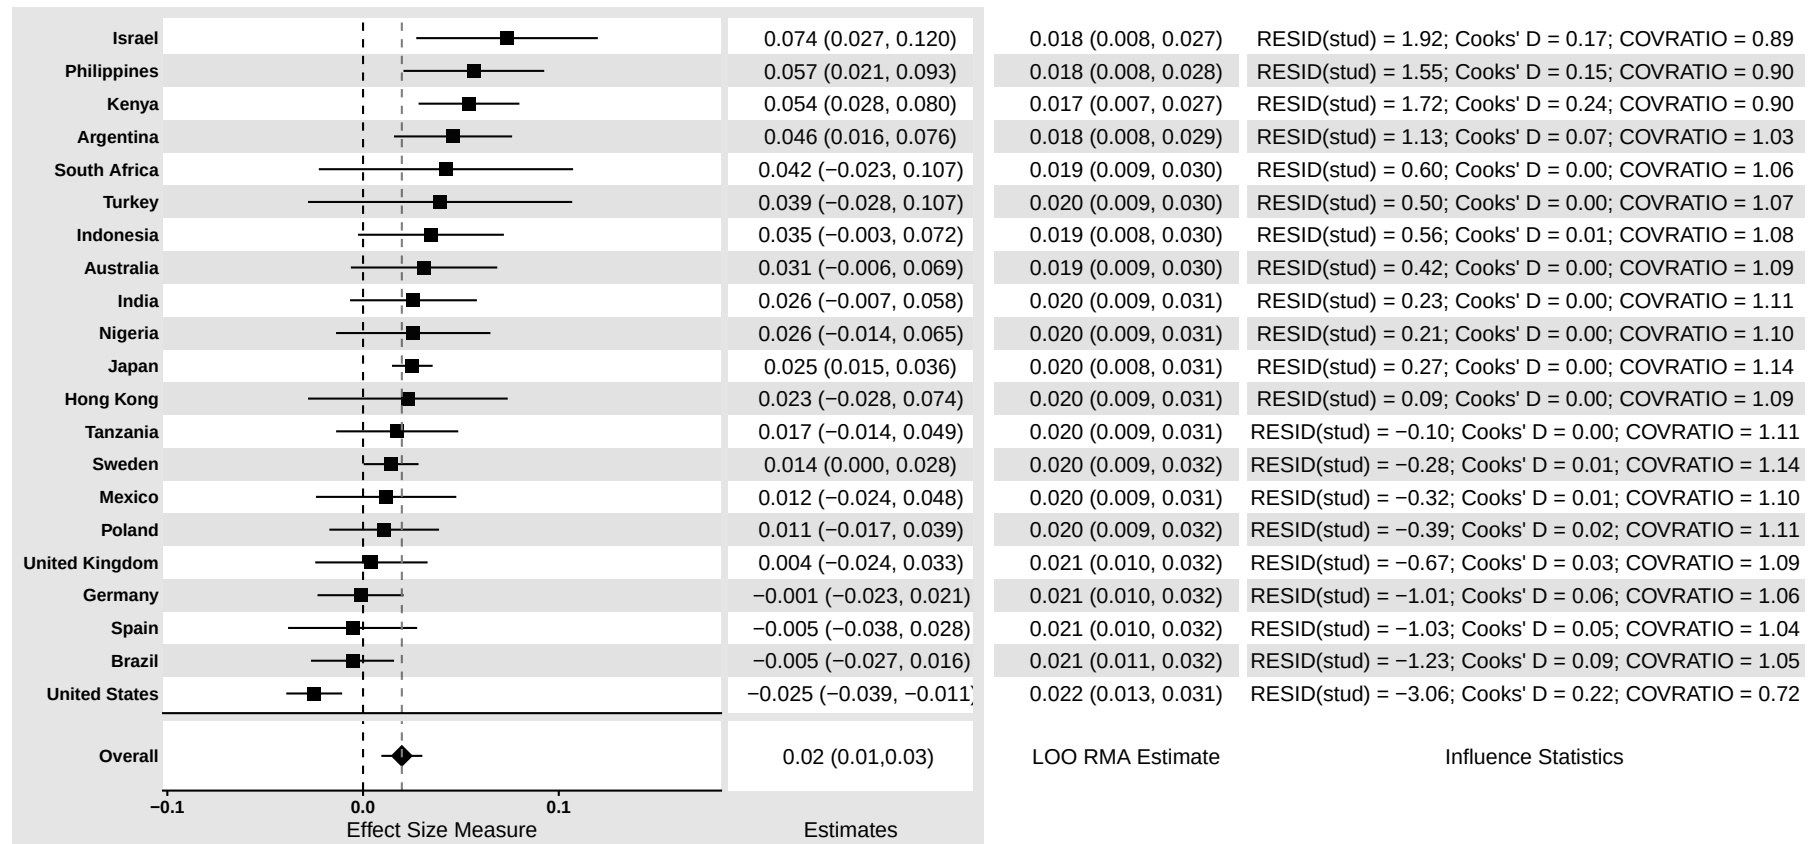

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S30. Heterogeneity in the effects of intimate/close friend at Wave 2 on secure flourishing index at Wave 3 scores across countries.

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

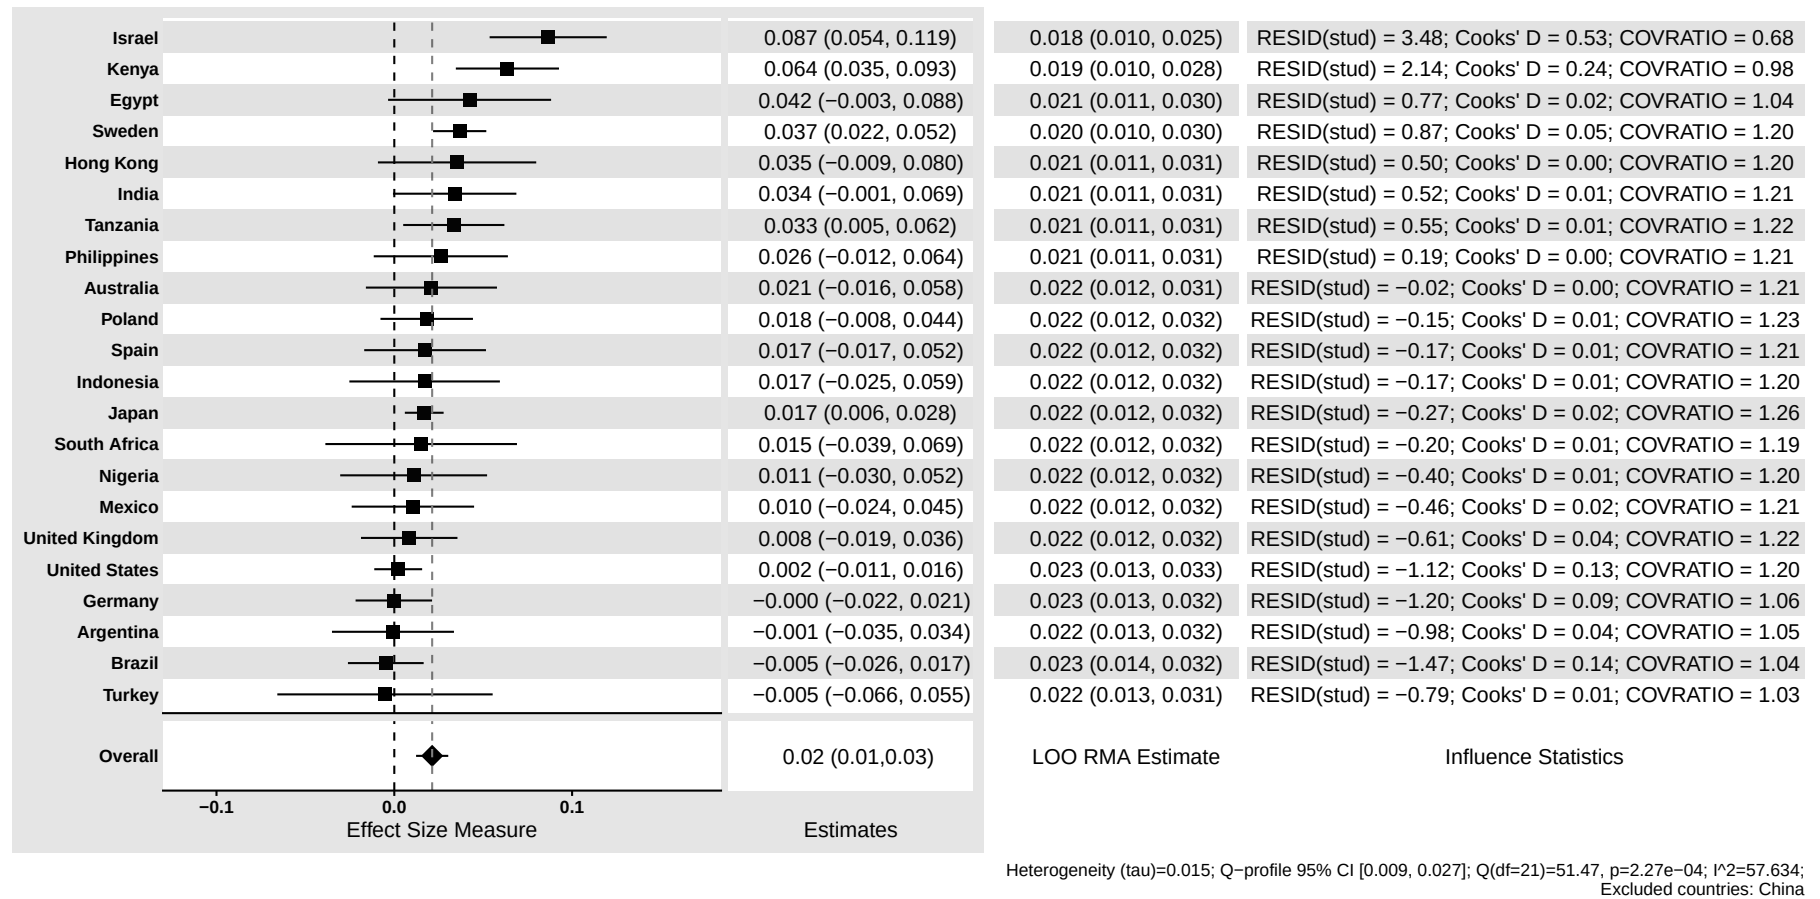

Figure S31. Heterogeneity in the effects of government approval at Wave 2 on secure flourishing index at Wave 3 scores across countries.

Heterogeneity (τ)=0.019; Q-profile 95% CI [0.012, 0.029]; Q(df=20)=70.11, $p=1.75e-07$; $I^2=68.195$;
Excluded countries: Egypt, China

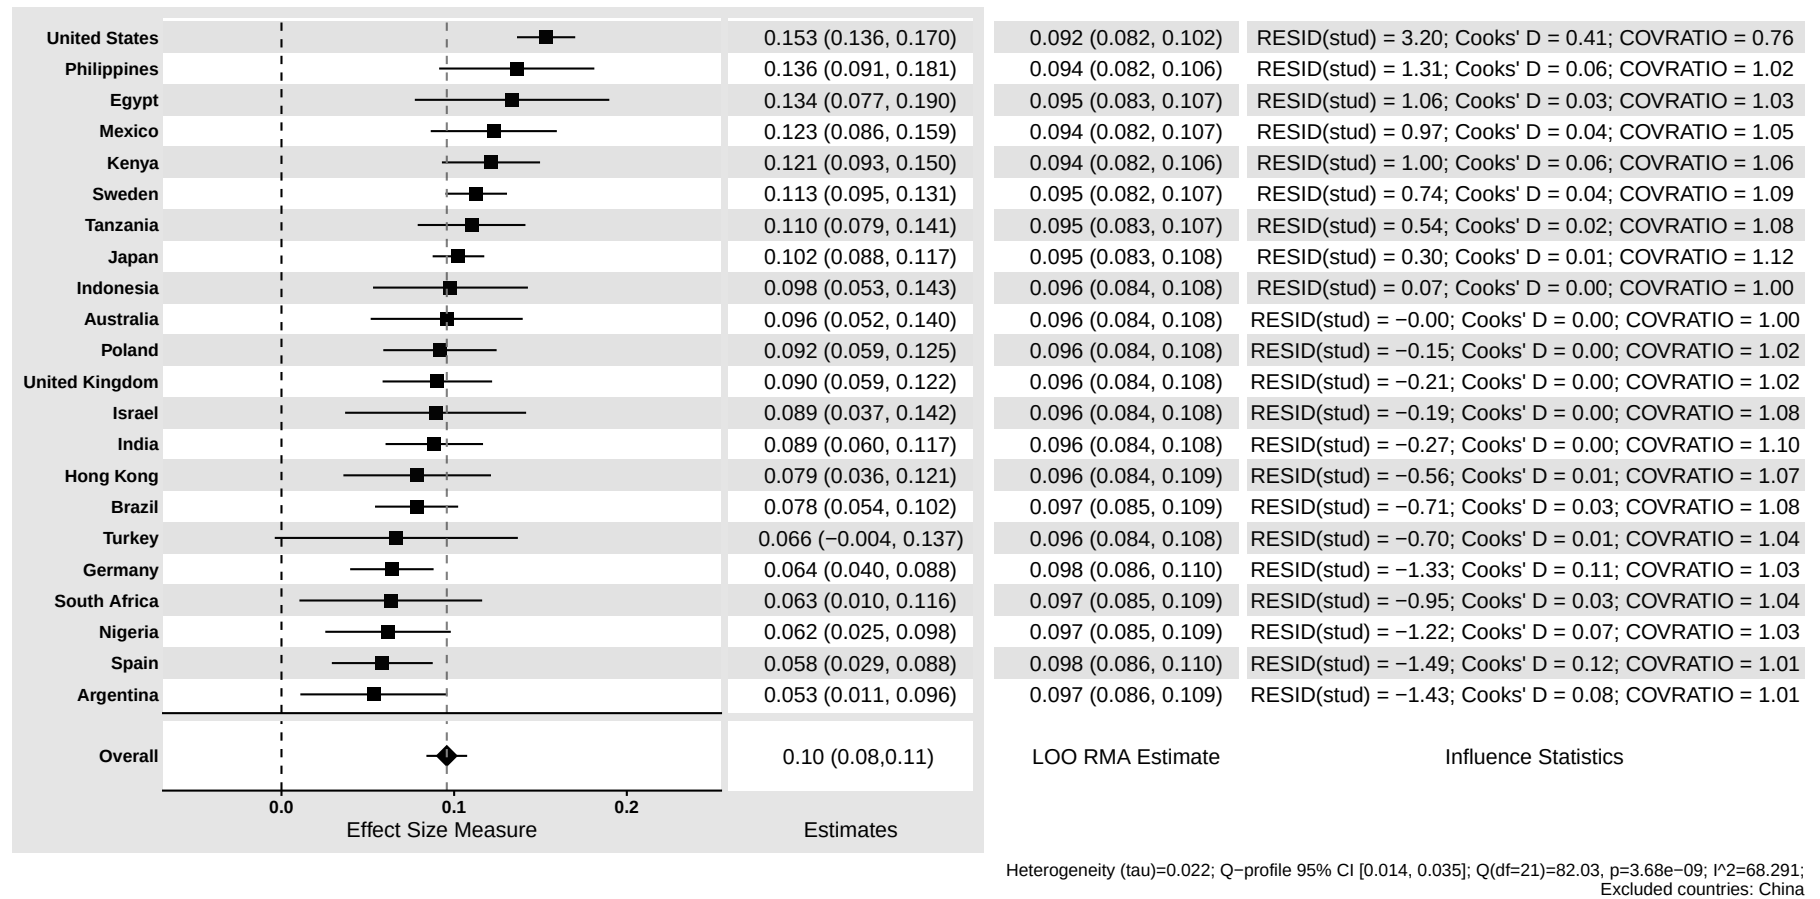

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S32. Heterogeneity in the effects of say in government at Wave 2 on secure flourishing index at Wave 3 scores across countries.

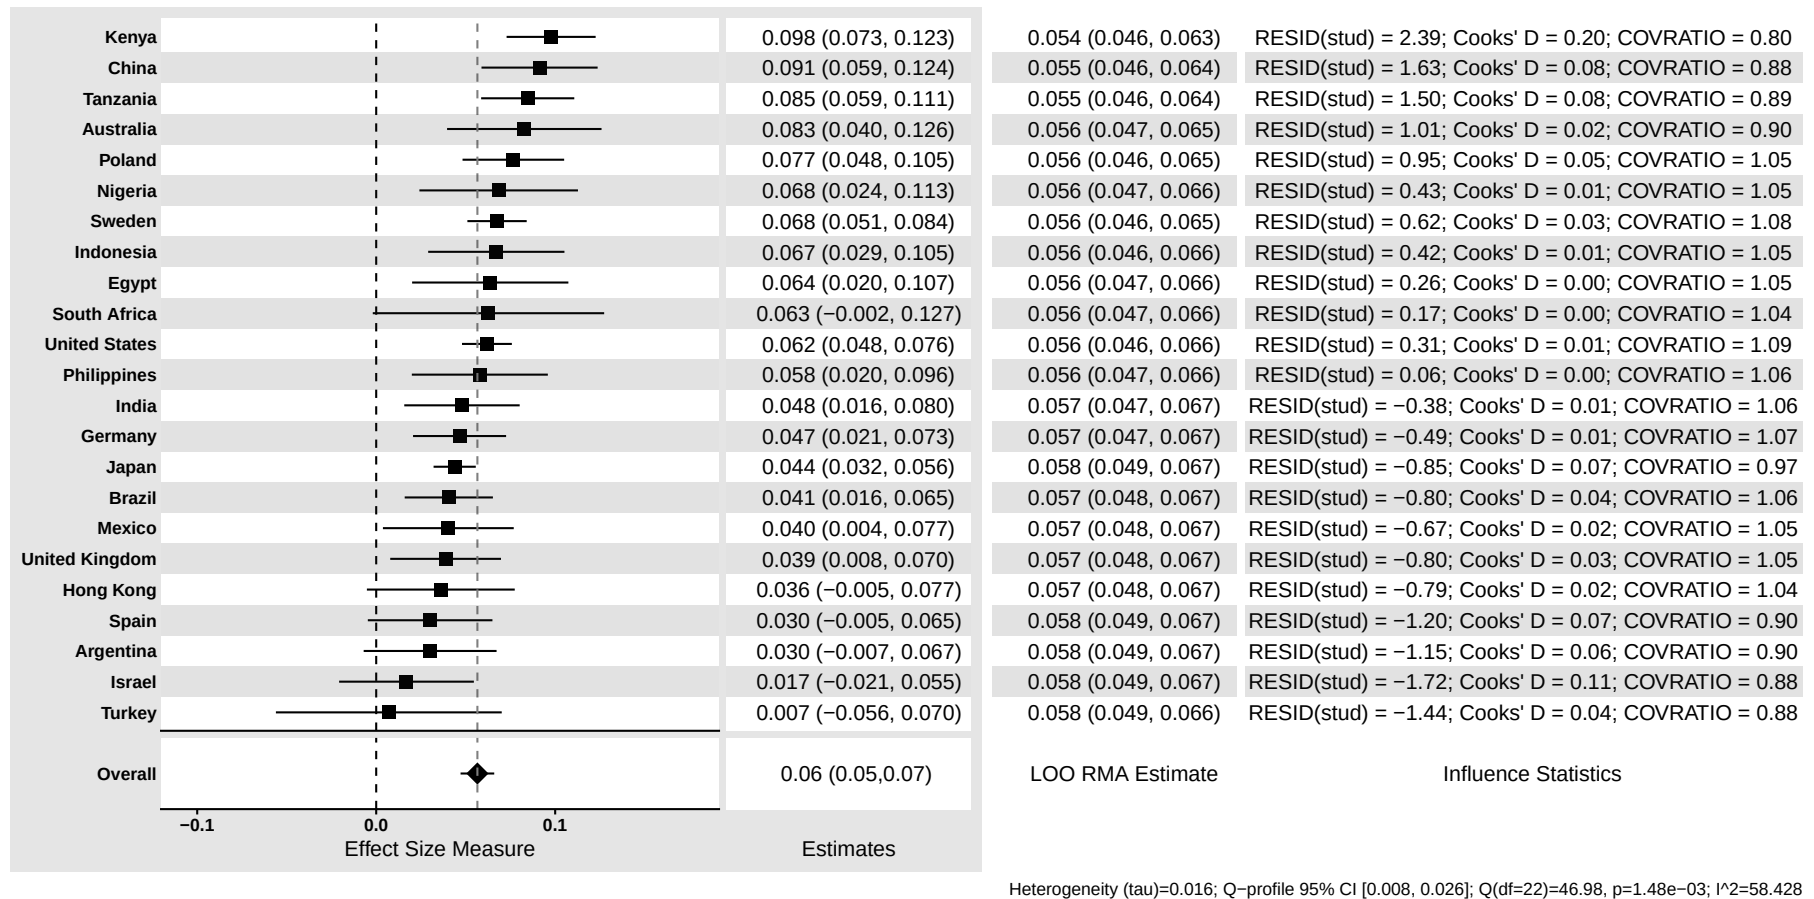

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S33. Heterogeneity in the effects of belonging in country at Wave 2 on secure flourishing index at Wave 3 scores across countries.

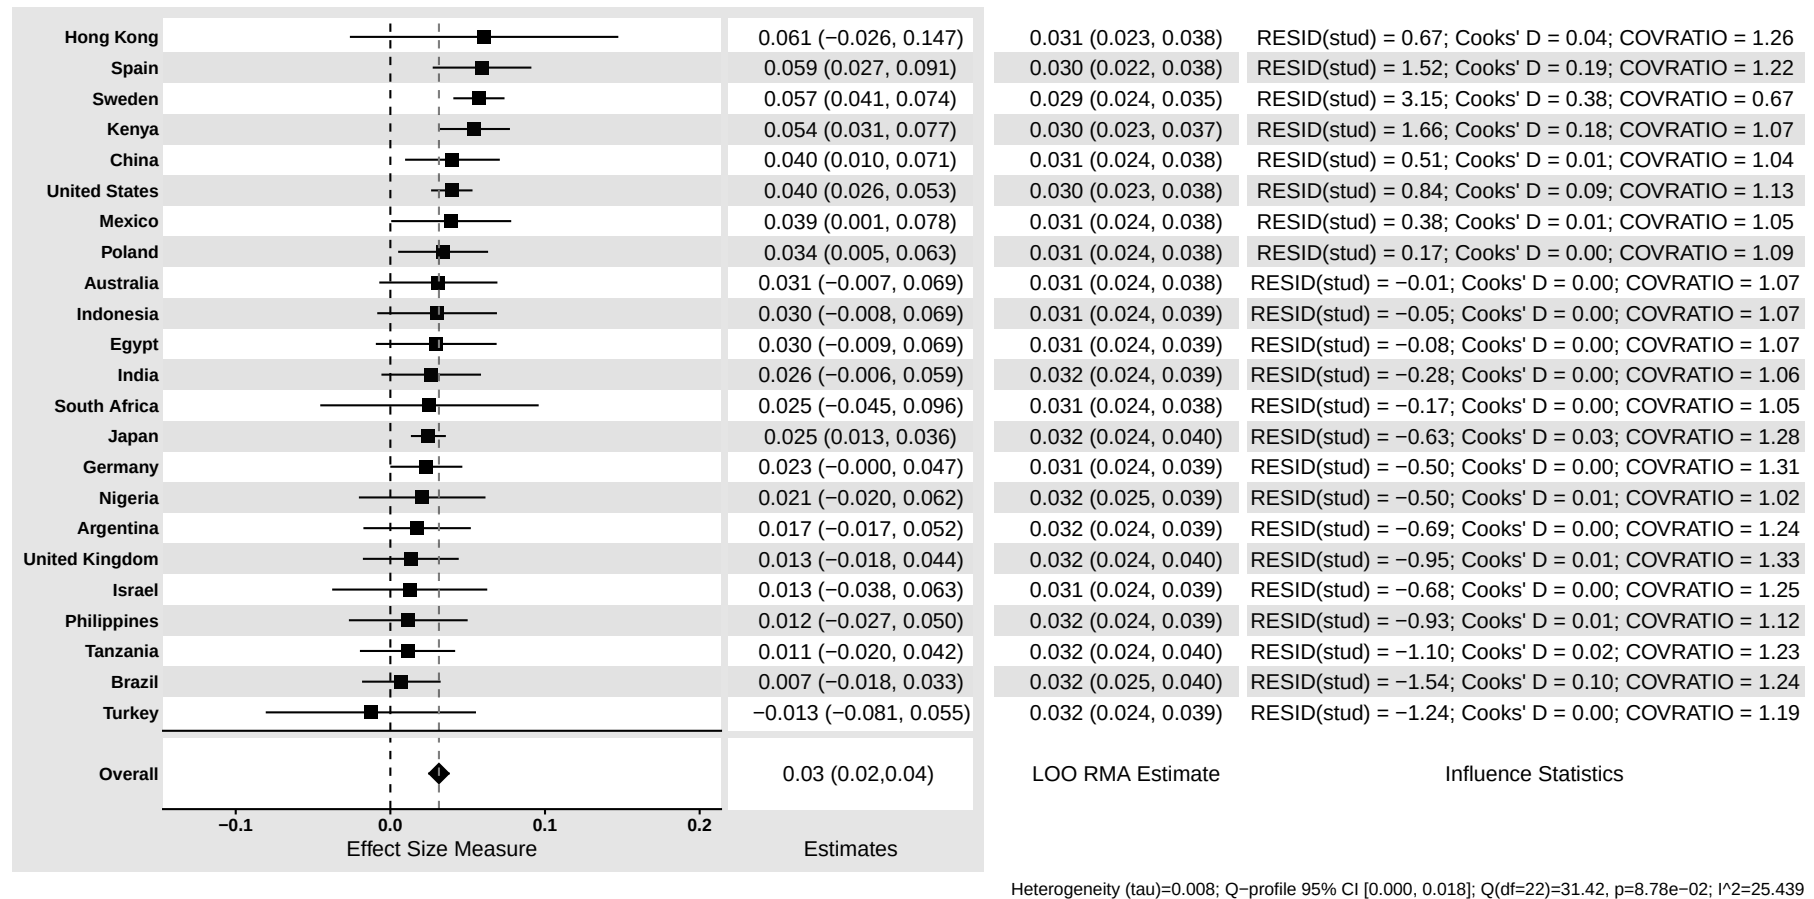

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S34. Heterogeneity in the effects of city/place satisfaction at Wave 2 on secure flourishing index at Wave 3 scores across countries.

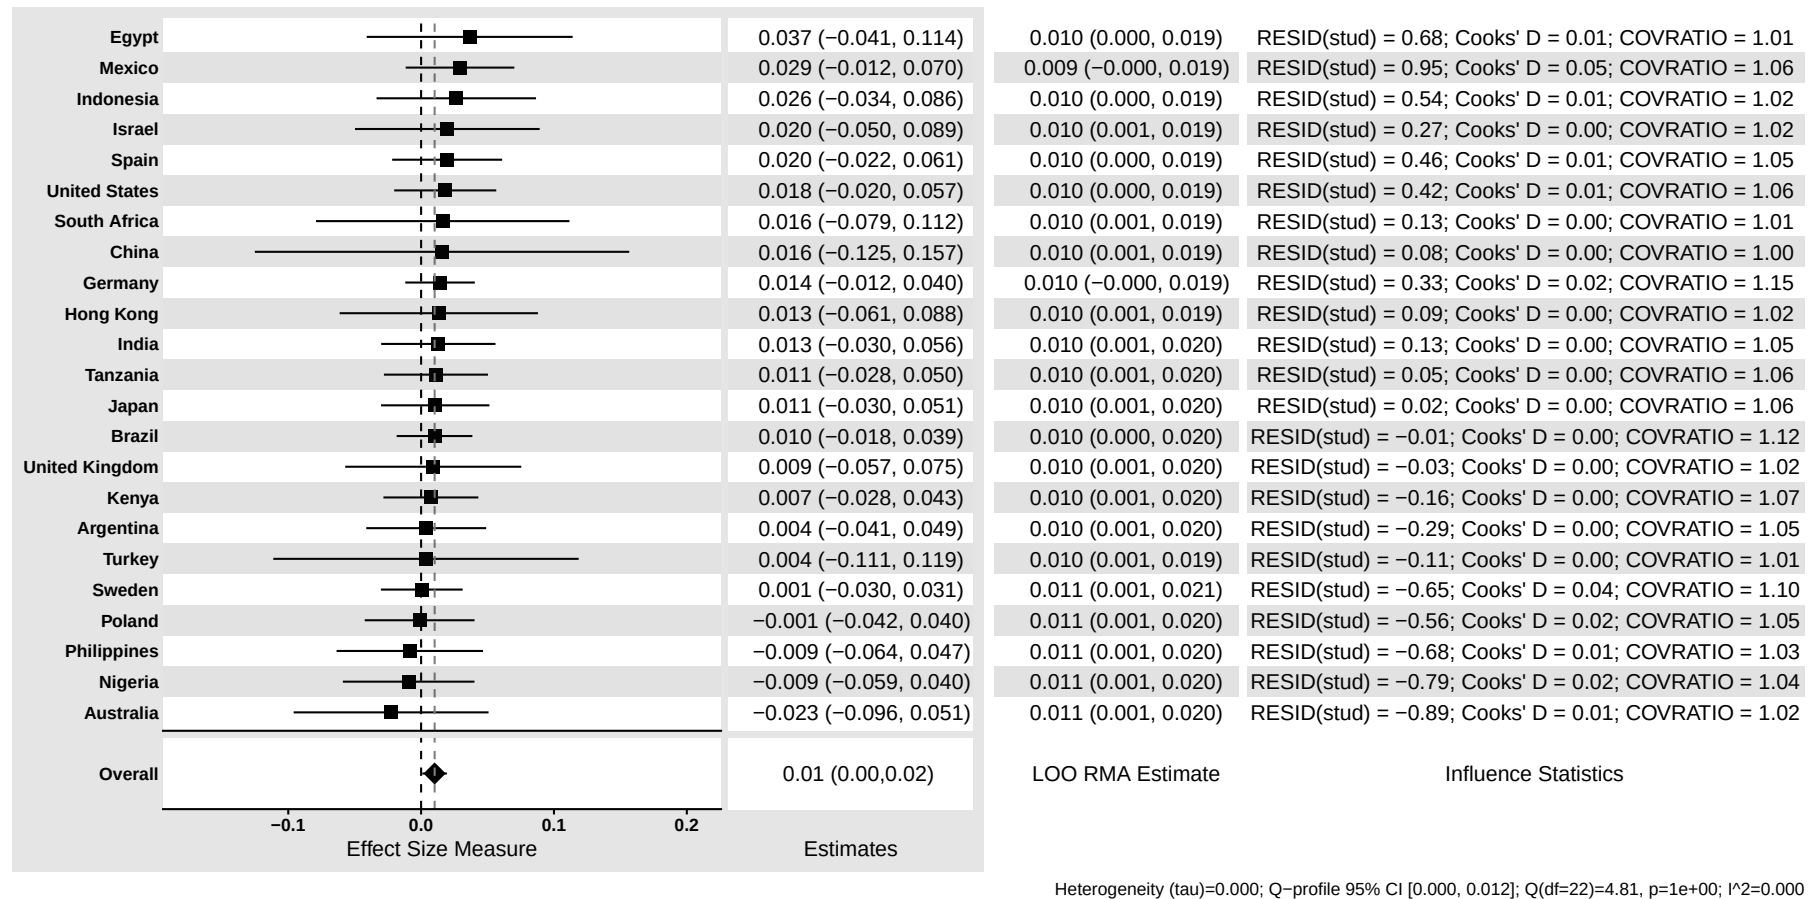

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S35. Heterogeneity in the effects of trust within country at Wave 2 on secure flourishing index at Wave 3 scores across countries.

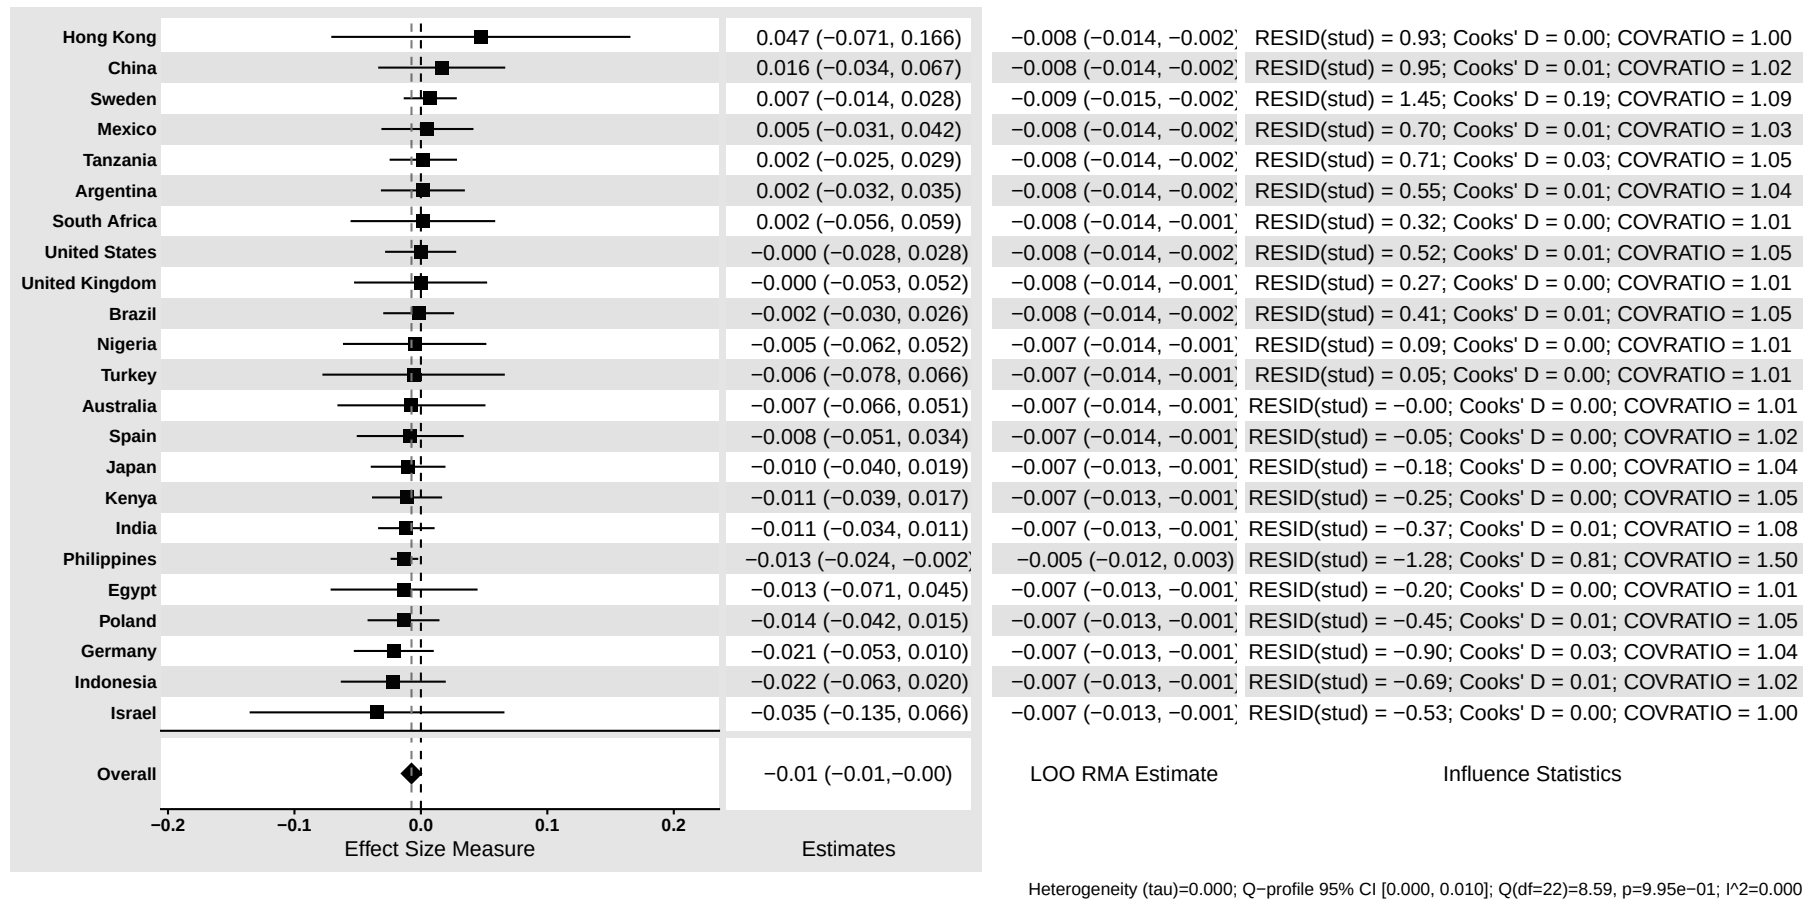

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S36. Heterogeneity in the effects of ever been married at Wave 2 on secure flourishing index at Wave 3 scores across countries.

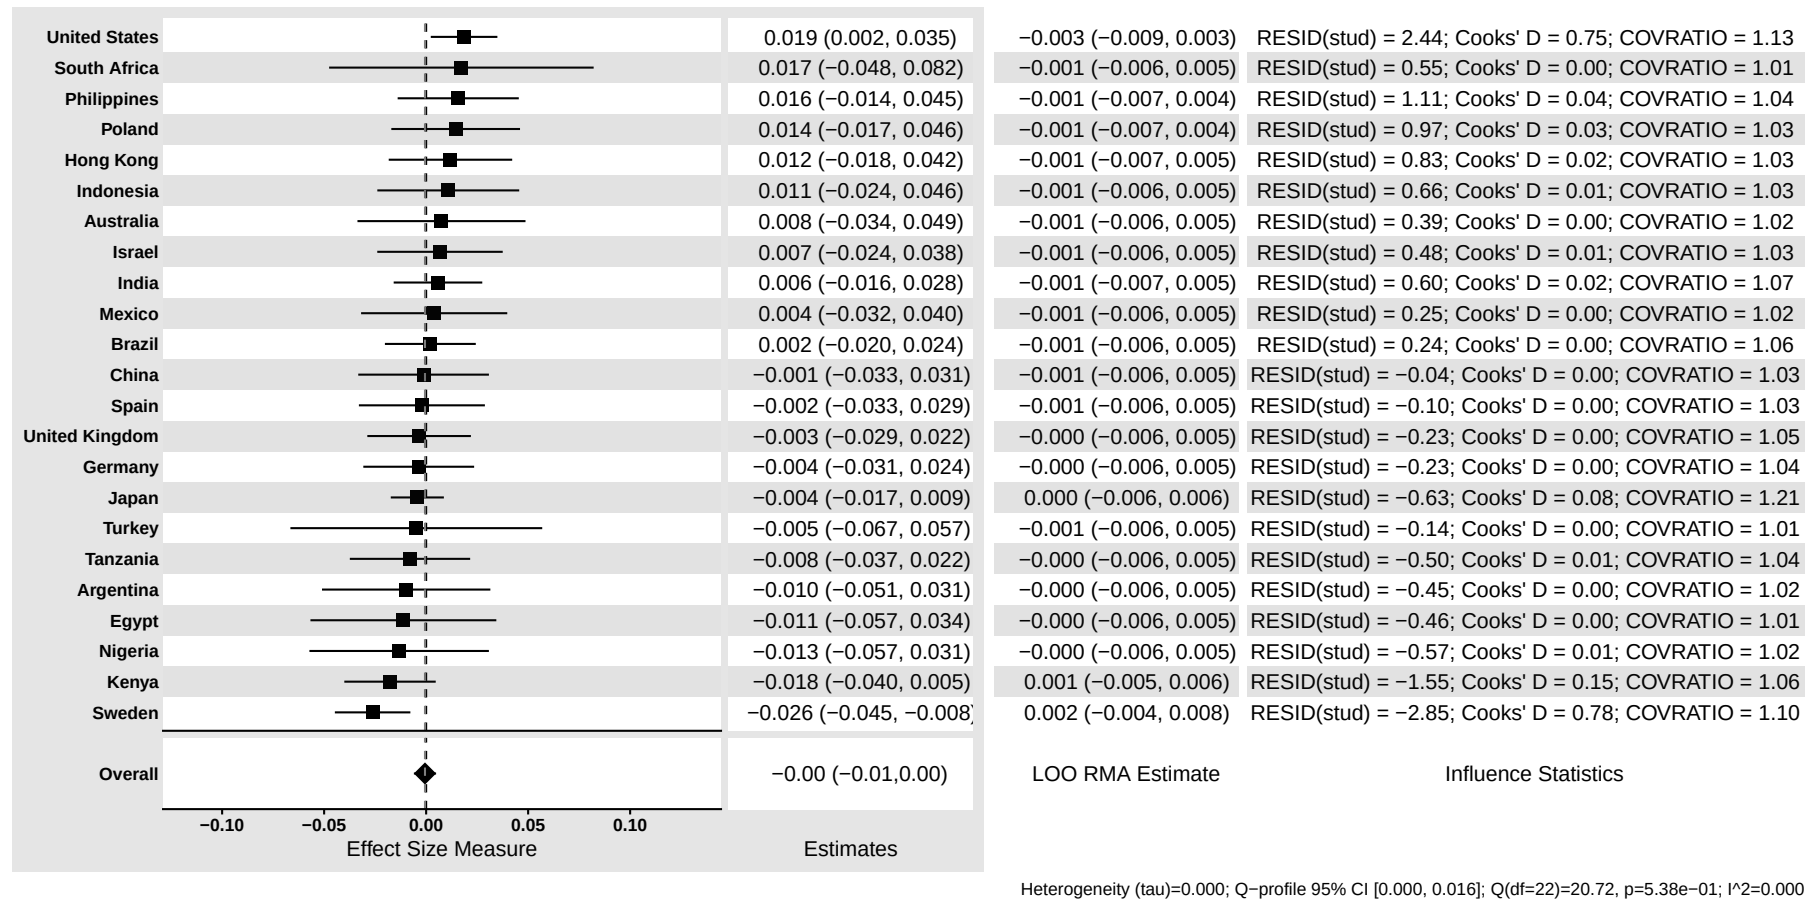

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S37. Heterogeneity in the effects of currently divorced at Wave 2 on secure flourishing index at Wave 3 scores across countries.

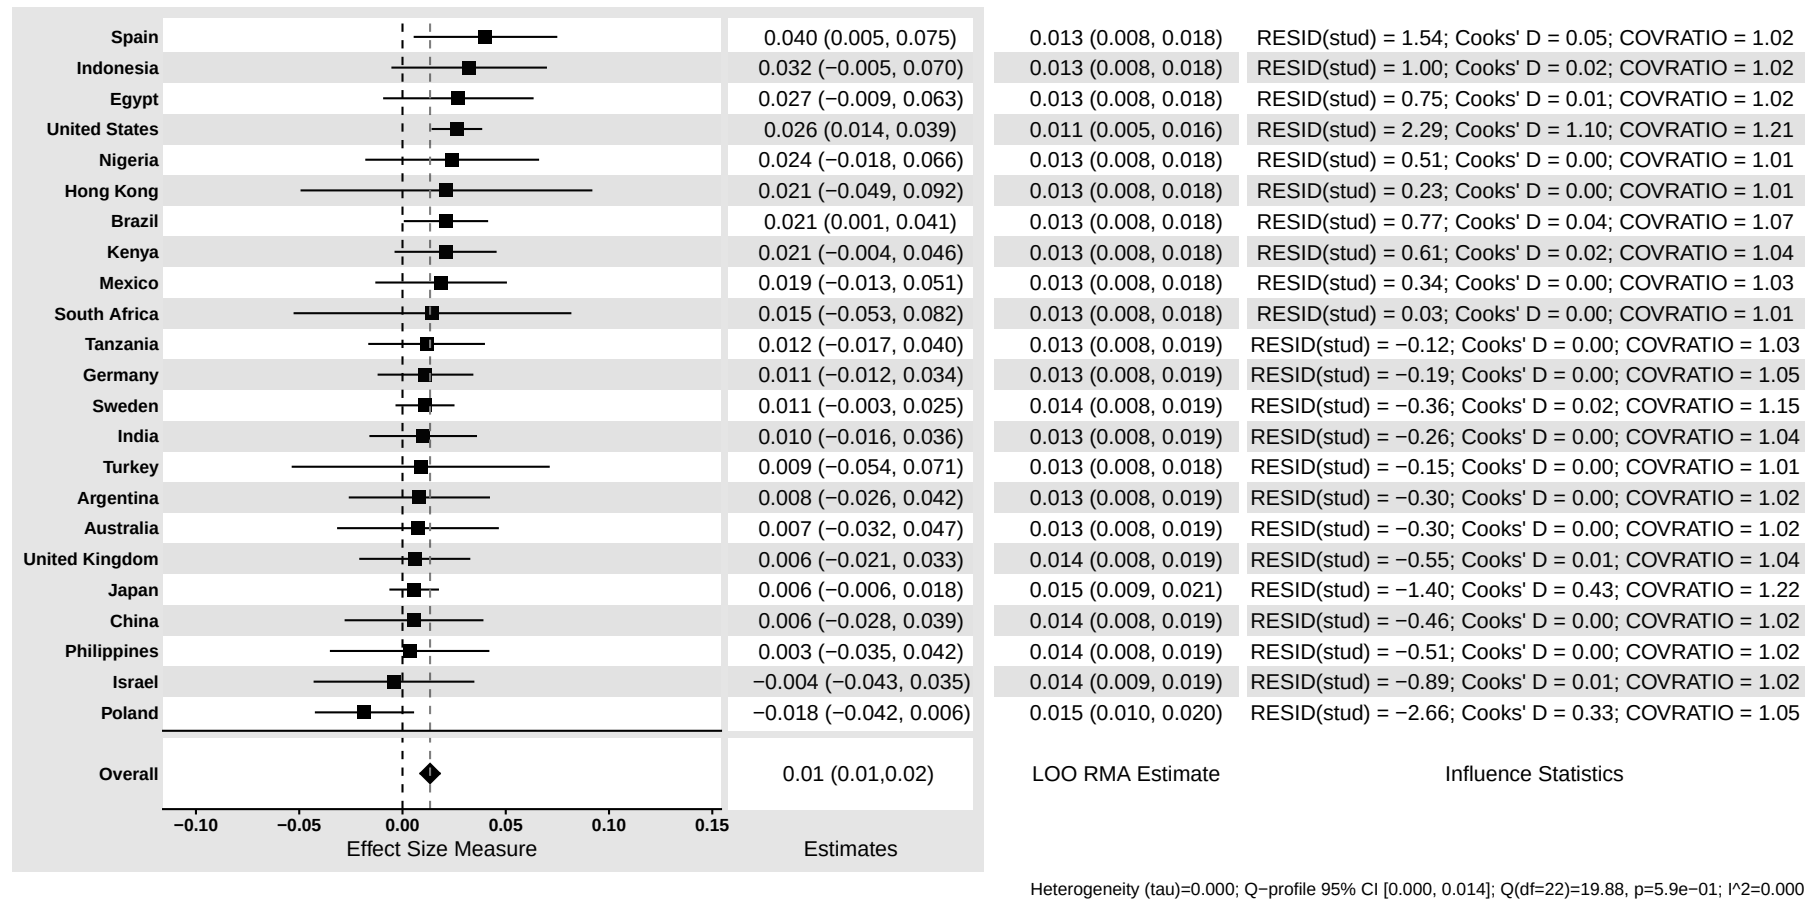

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S38. Heterogeneity in the effects of number of children at Wave 2 on secure flourishing index at Wave 3 scores across countries.

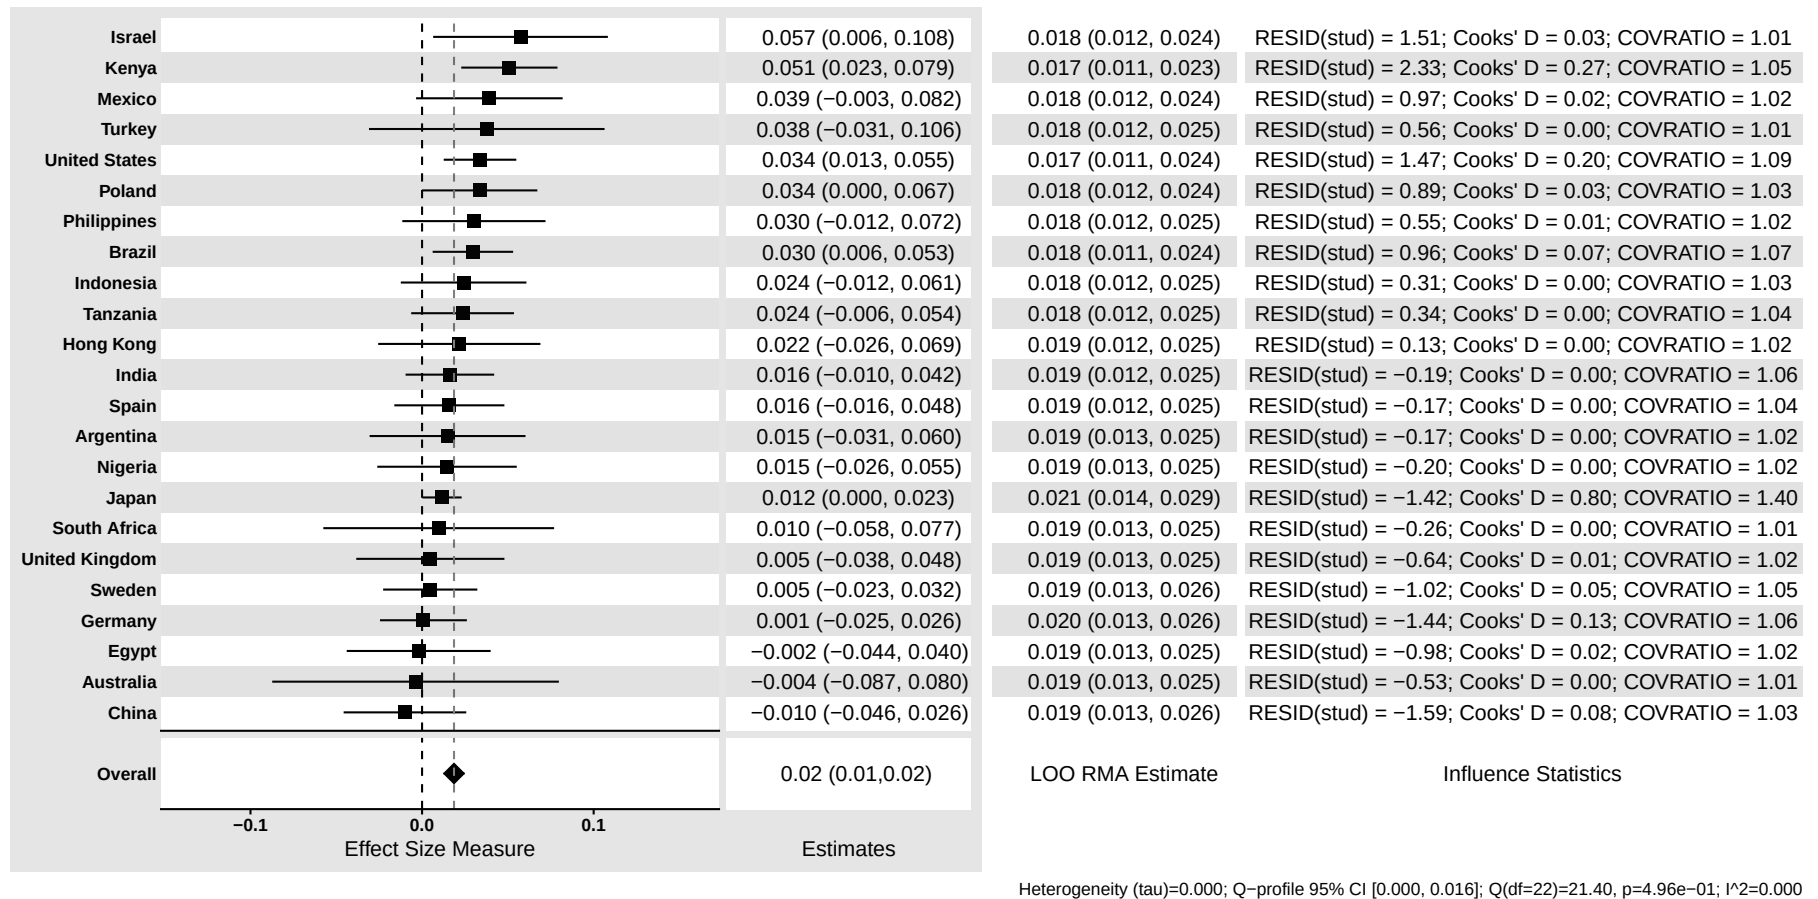

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S39. Heterogeneity in the effects of community participation at Wave 2 on secure flourishing index at Wave 3 scores across countries.

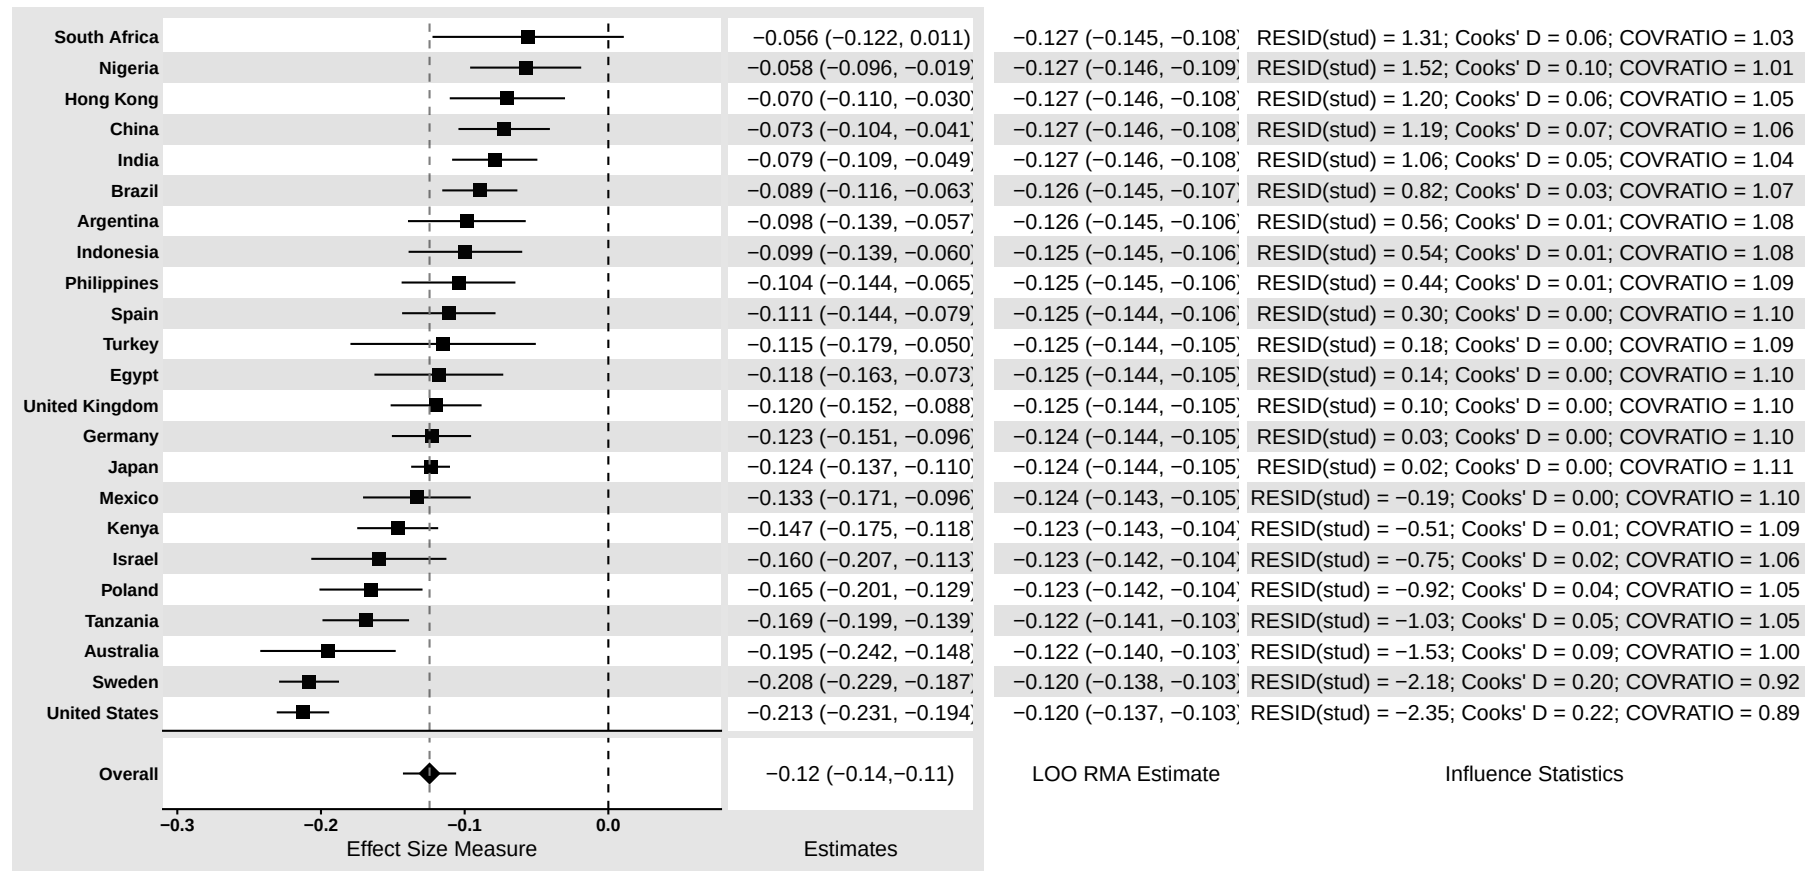

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S40. Heterogeneity in the effects of religious attendance at Wave 2 on secure flourishing index at Wave 3 scores across countries.

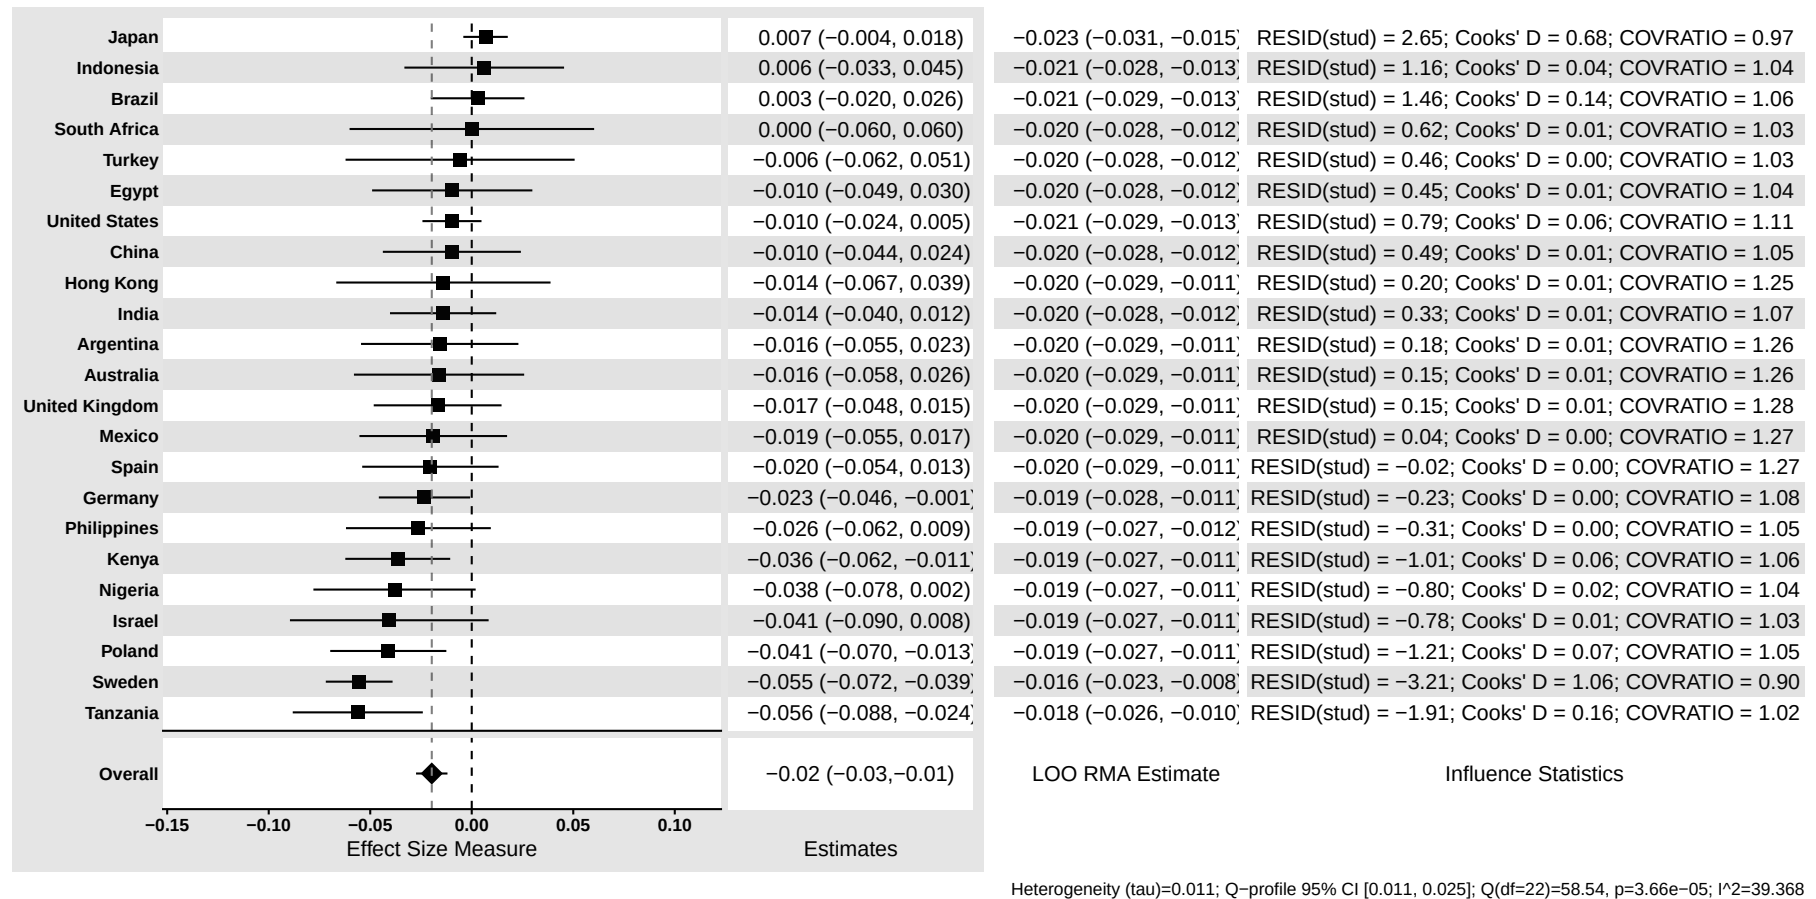

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S41. Heterogeneity in the effects of loneliness at Wave 2 on secure flourishing index at Wave 3 scores across countries.

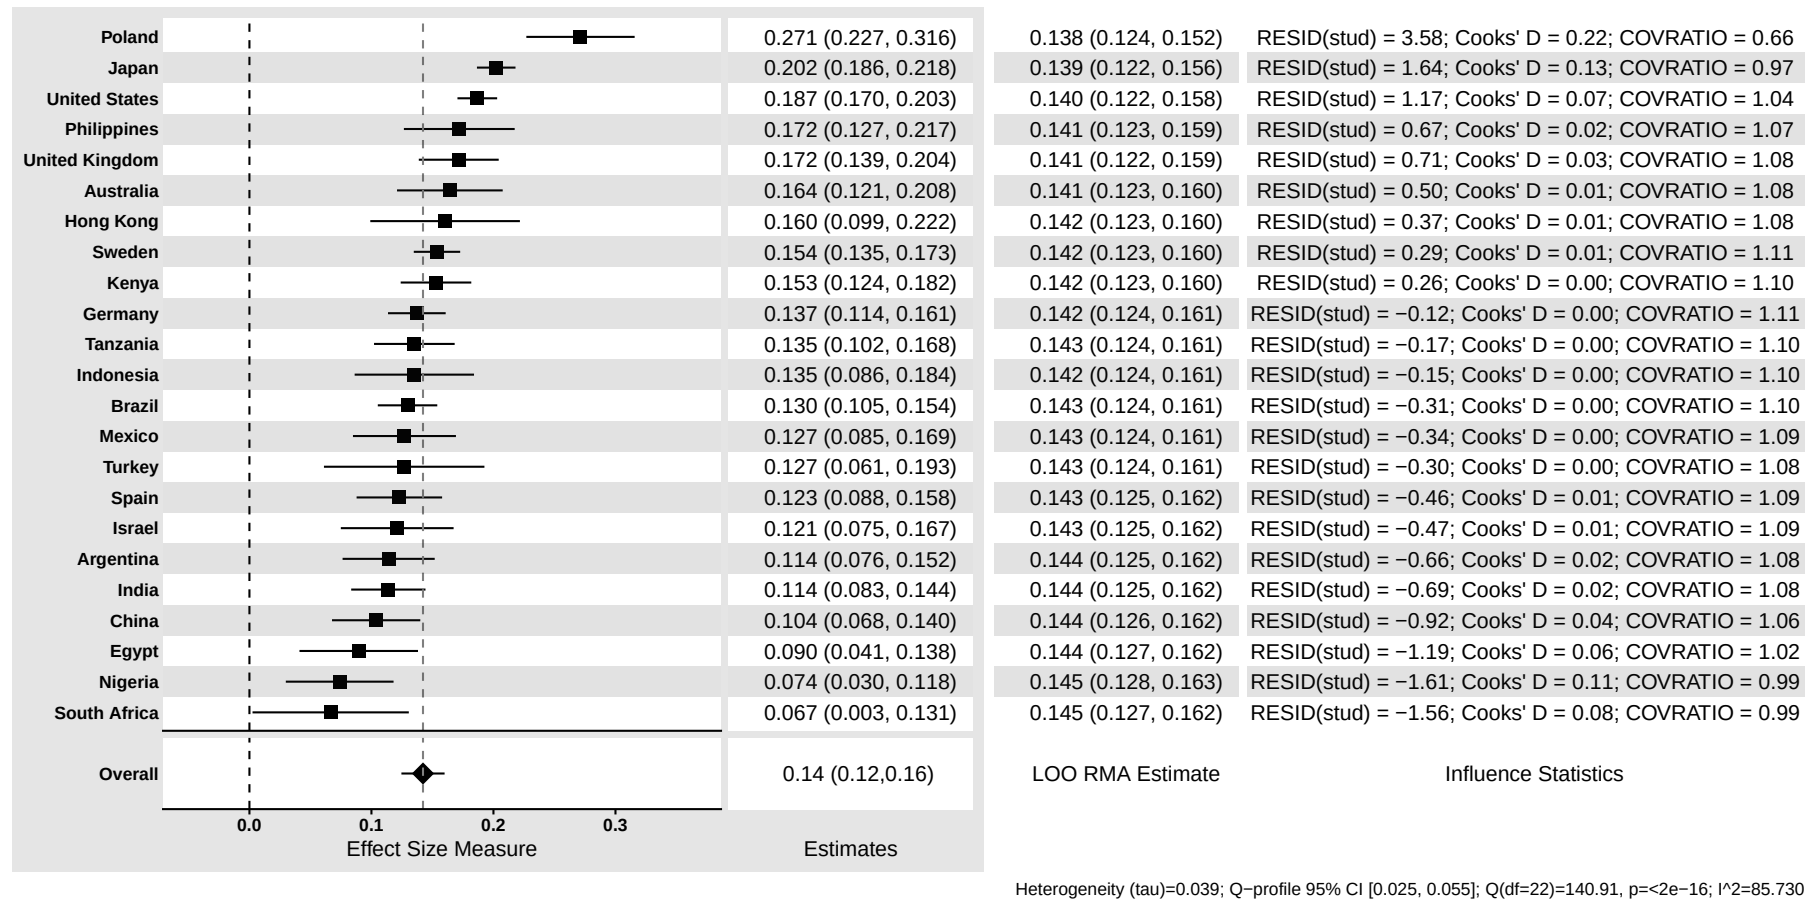

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S42. *Heterogeneity in the effects of perceived discrimination at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

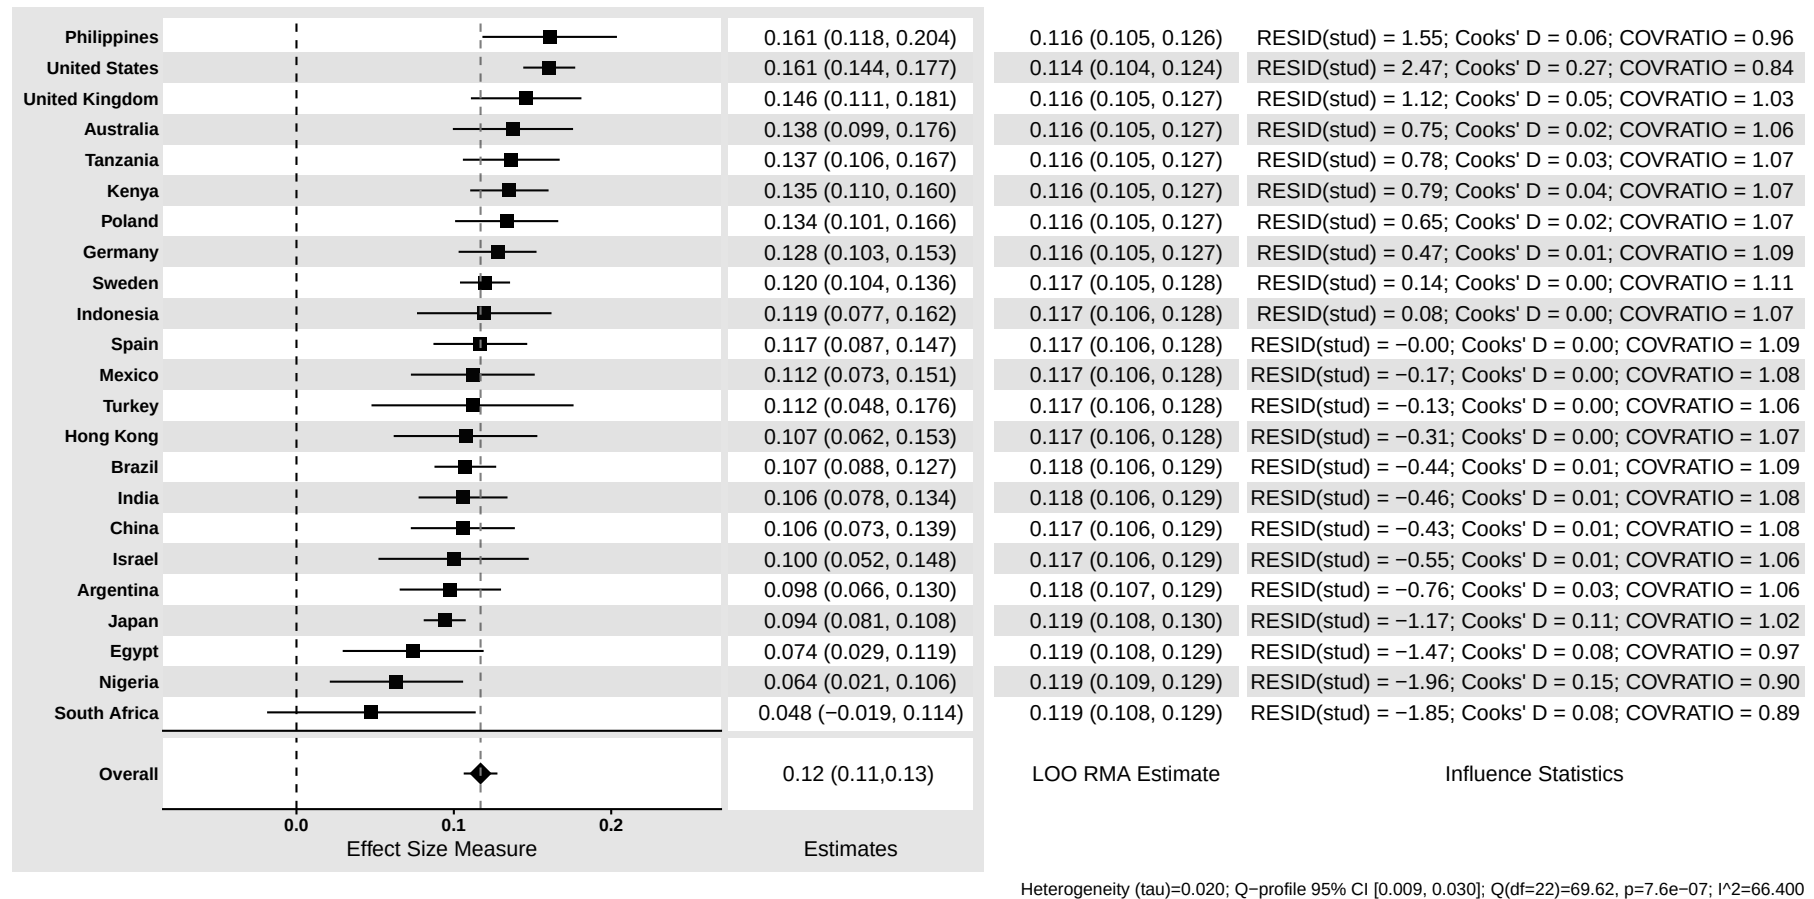

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S43. Heterogeneity in the effects of orientation to promote good at Wave 2 on secure flourishing index at Wave 3 scores across countries.

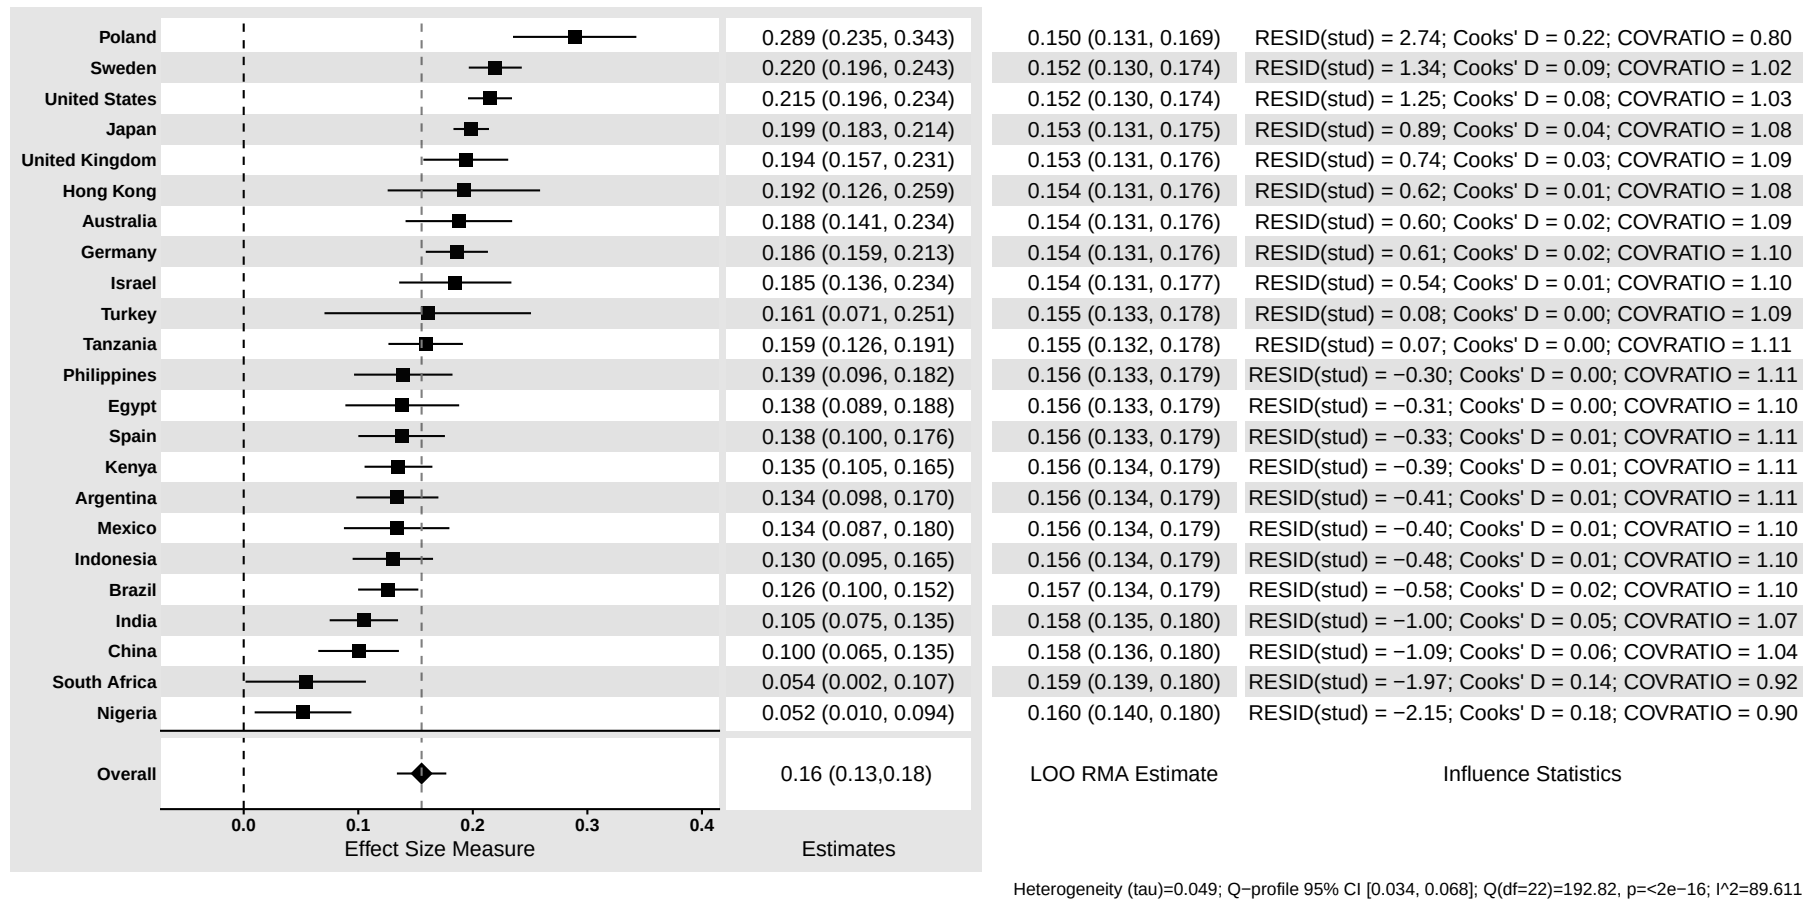

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S44. Heterogeneity in the effects of delayed gratification at Wave 2 on secure flourishing index at Wave 3 scores across countries.

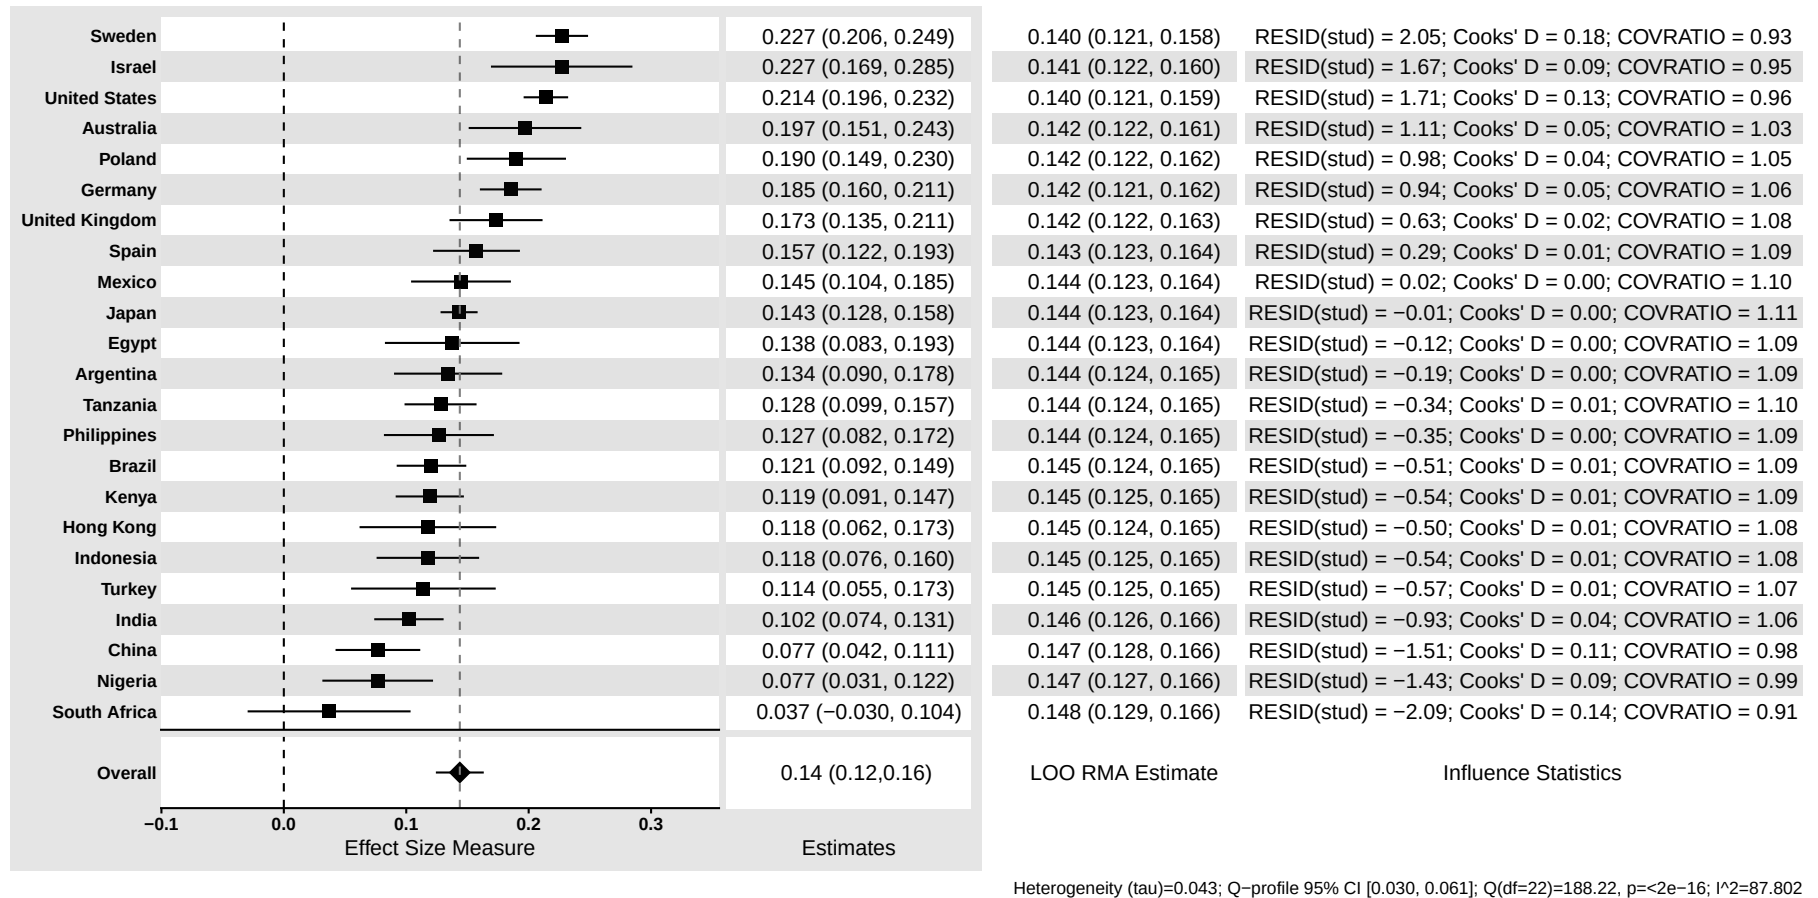

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S45. Heterogeneity in the effects of hope at Wave 2 on secure flourishing index at Wave 3 scores across countries.

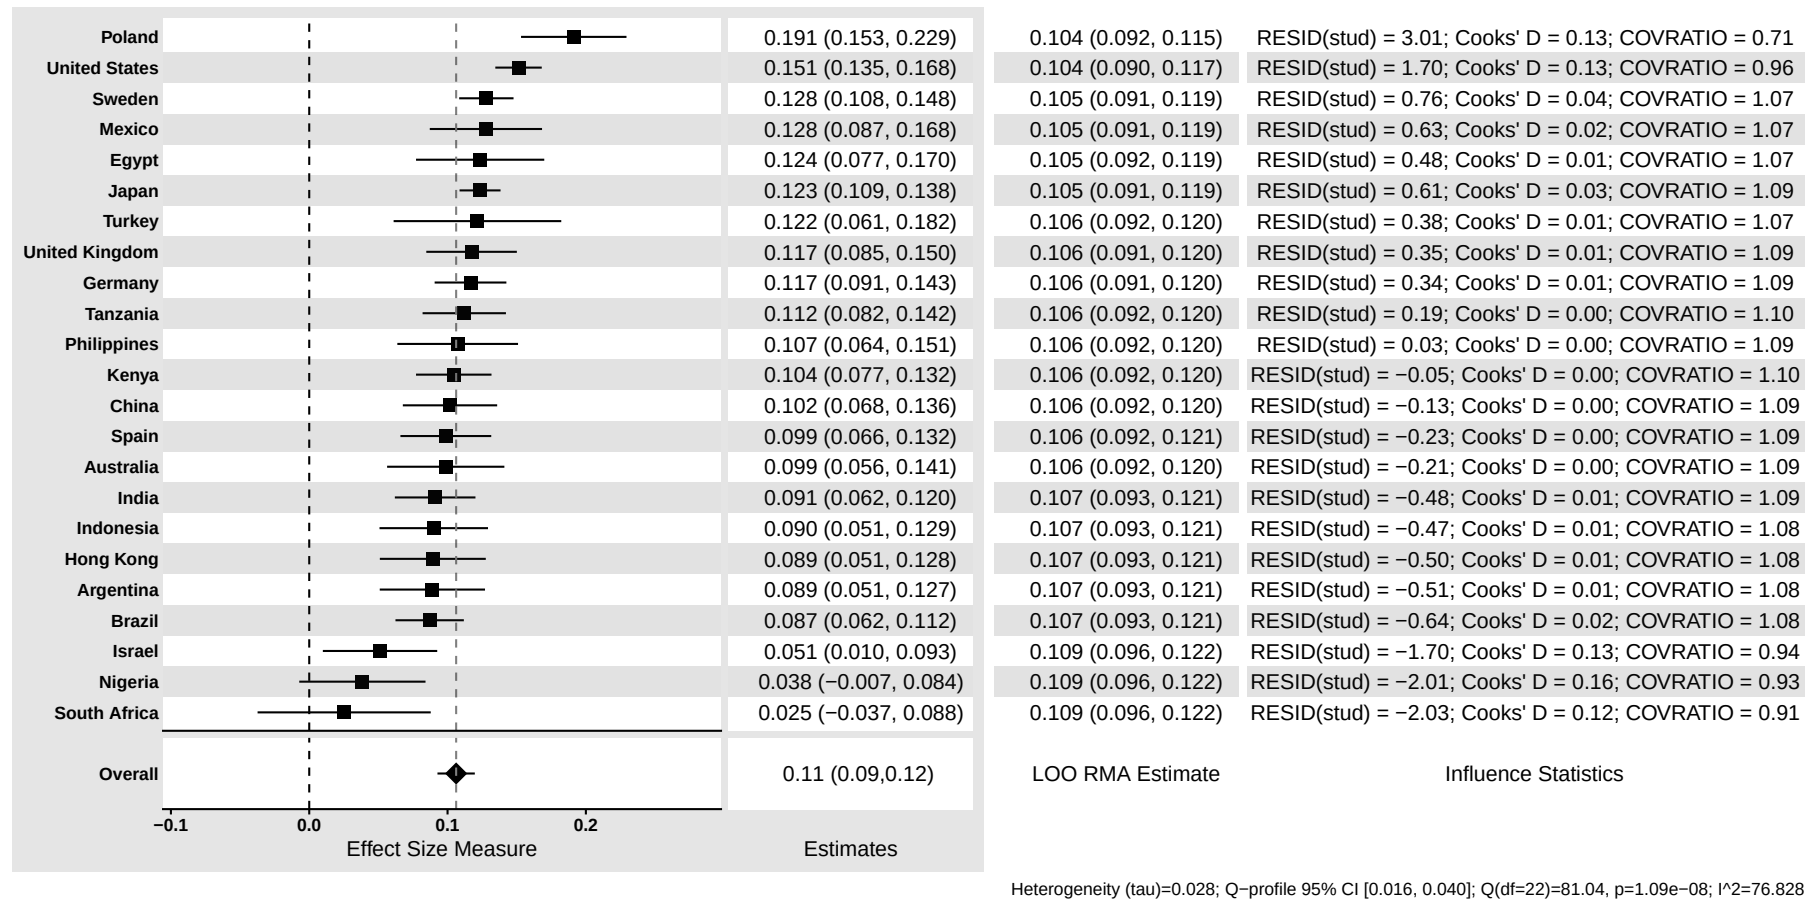

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S46. Heterogeneity in the effects of gratitude at Wave 2 on secure flourishing index at Wave 3 scores across countries.

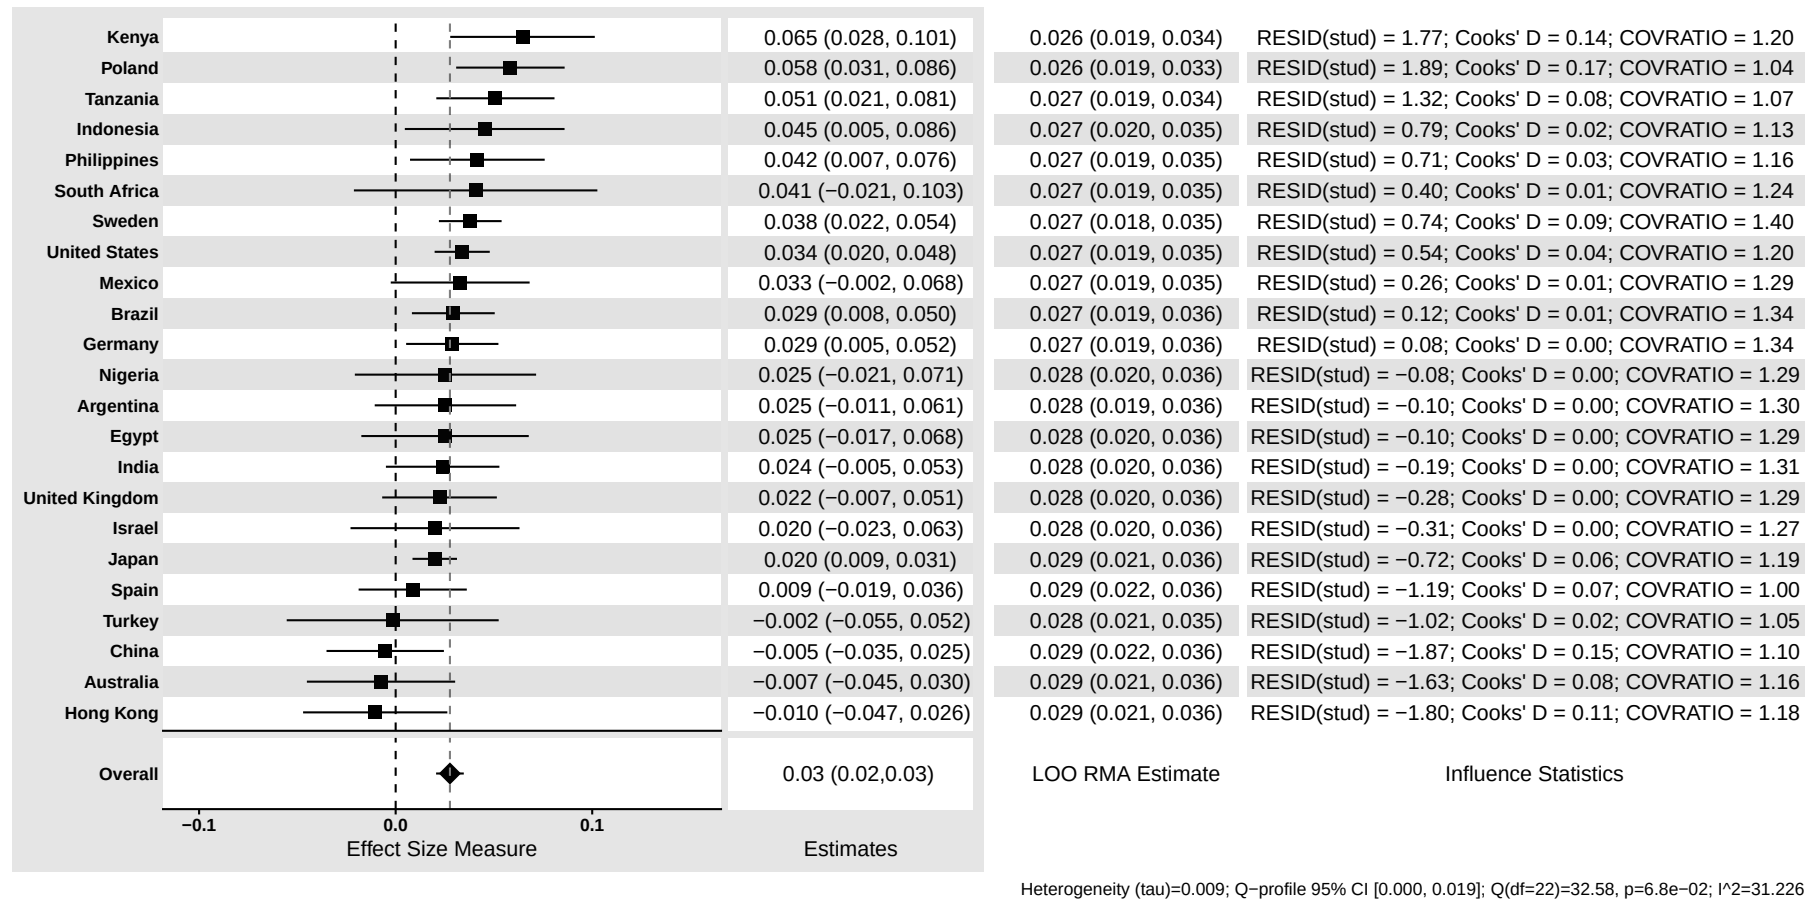

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S47. Heterogeneity in the effects of showing love/care at Wave 2 on secure flourishing index at Wave 3 scores across countries.

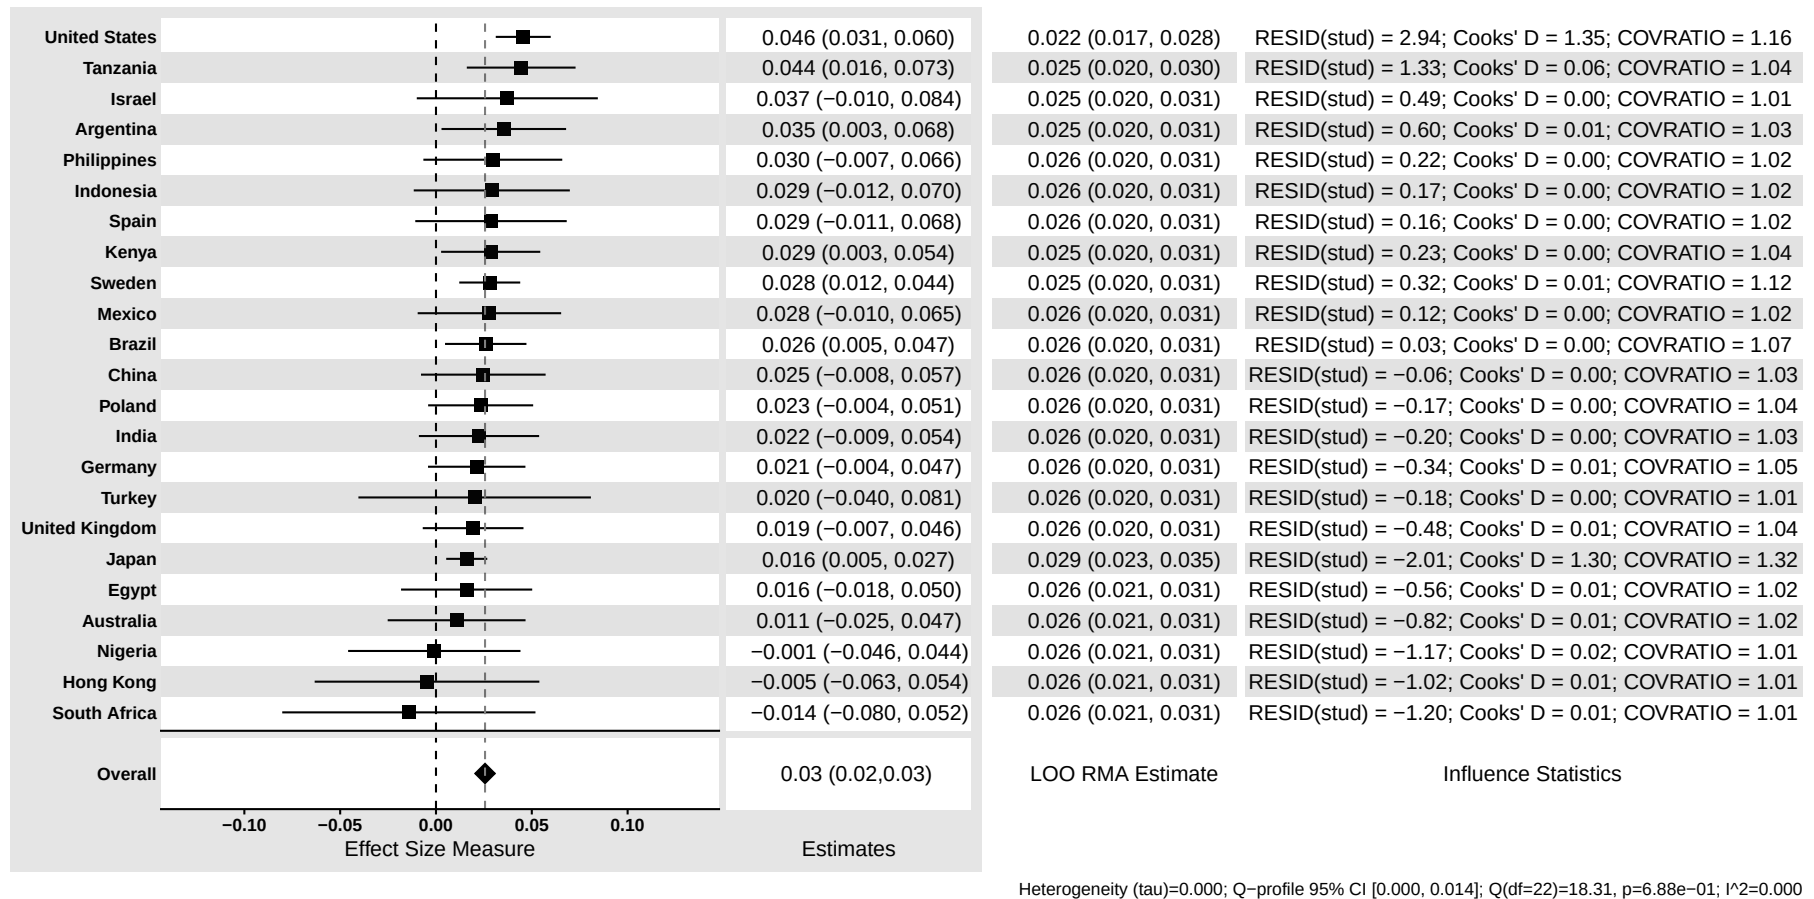

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S48. Heterogeneity in the effects of forgivingness at Wave 2 on secure flourishing index at Wave 3 scores across countries.

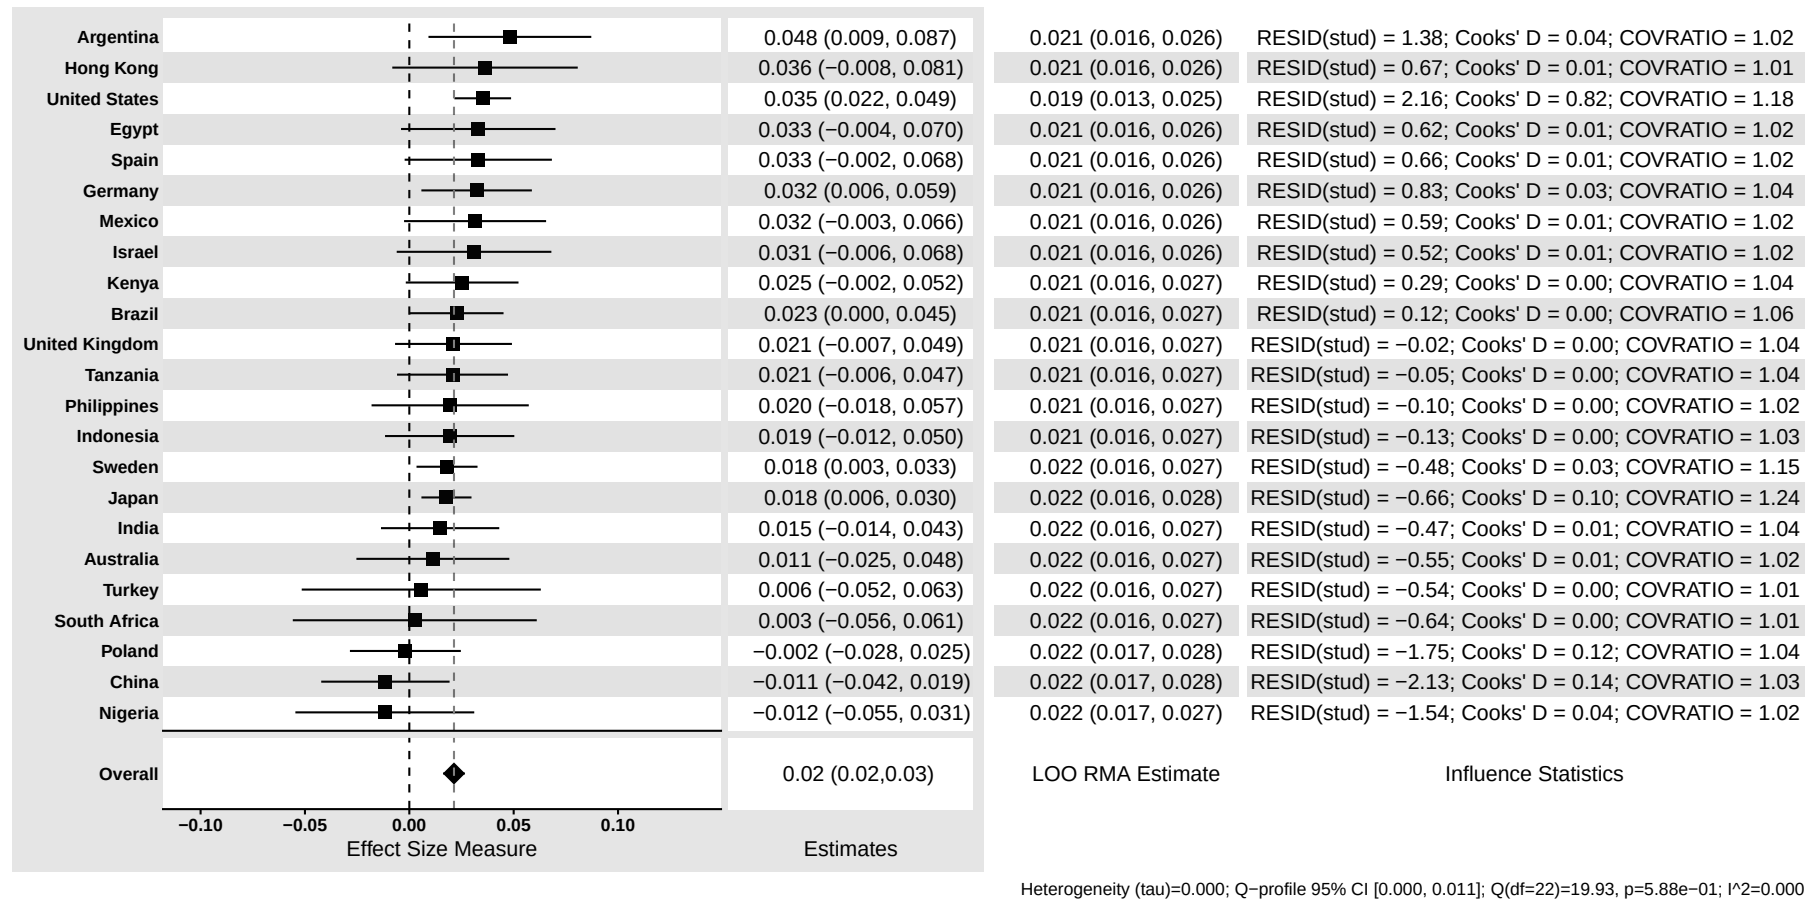

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S49. Heterogeneity in the effects of charitable giving at Wave 2 on secure flourishing index at Wave 3 scores across countries.

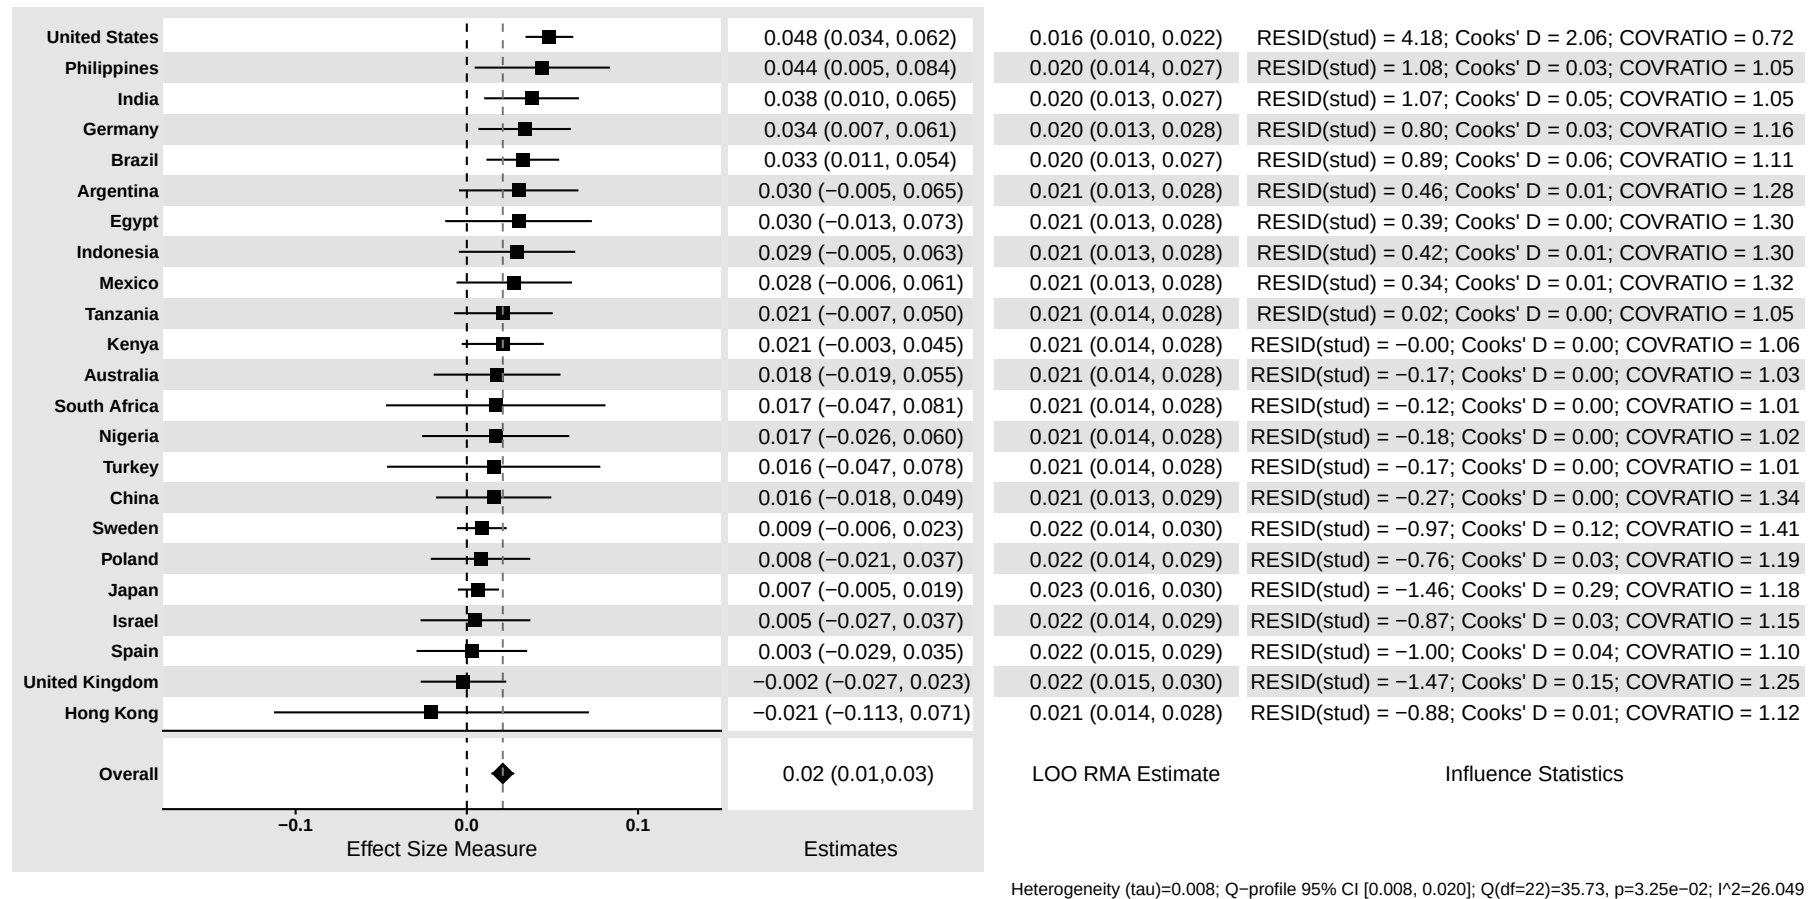

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S50. Heterogeneity in the effects of helping strangers at Wave 2 on secure flourishing index at Wave 3 scores across countries.

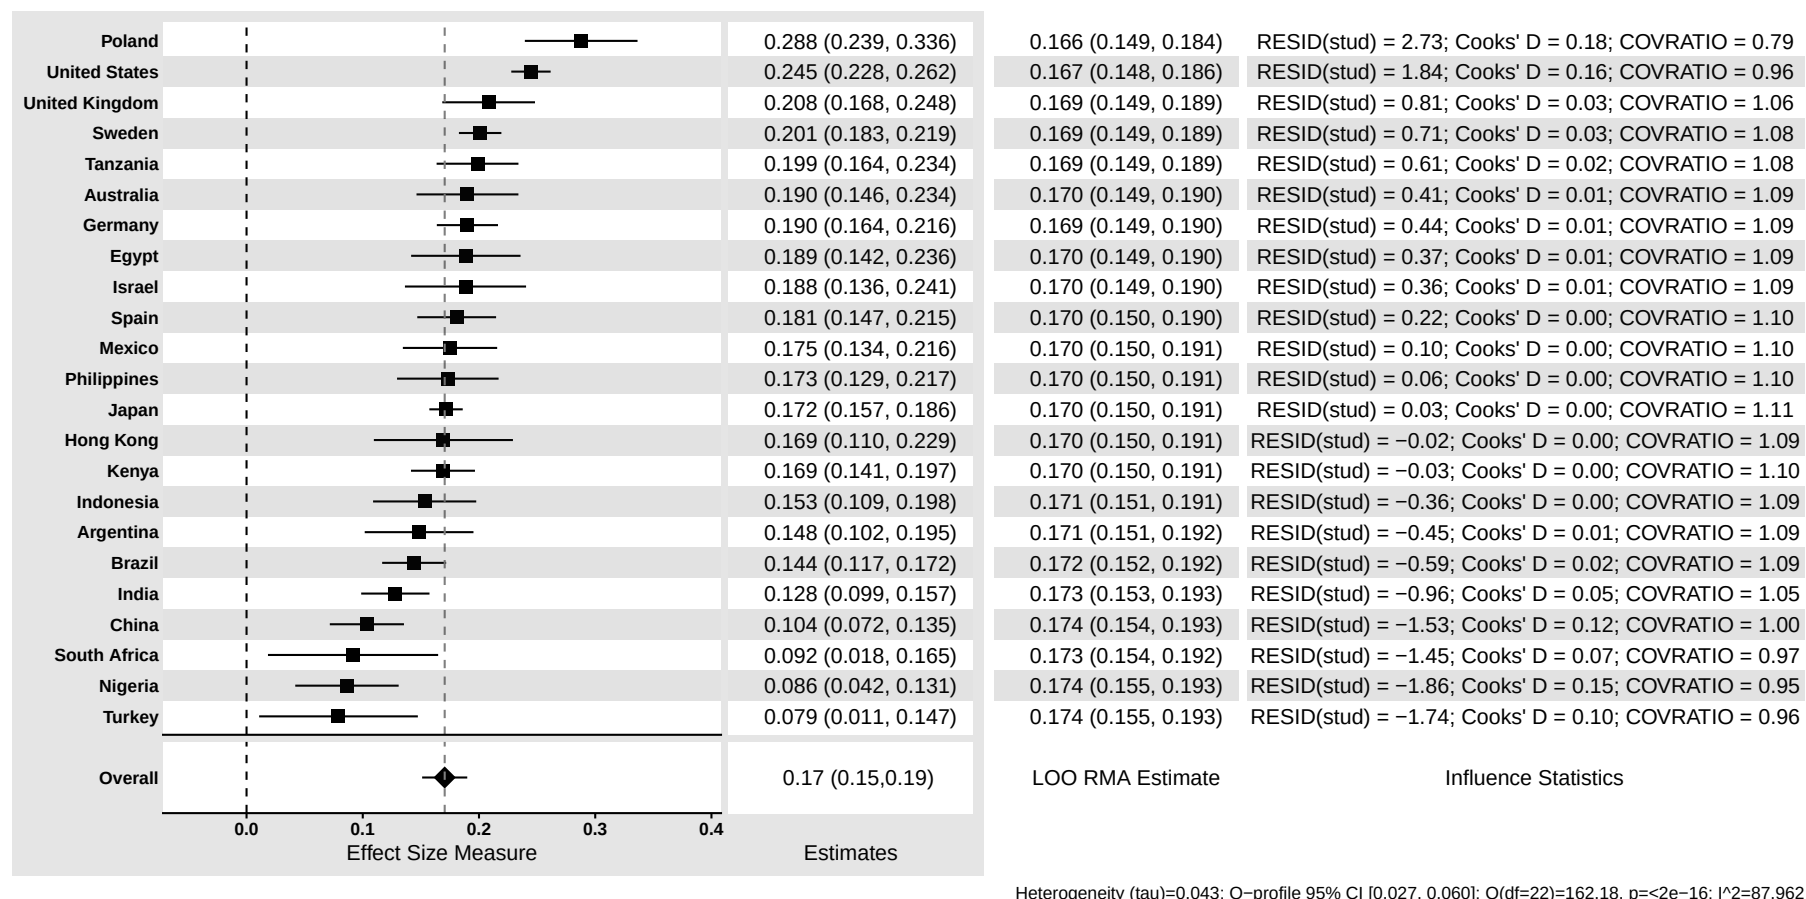

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S51. *Heterogeneity in the effects of volunteering at Wave 2 on secure flourishing index at Wave 3 scores across countries.*

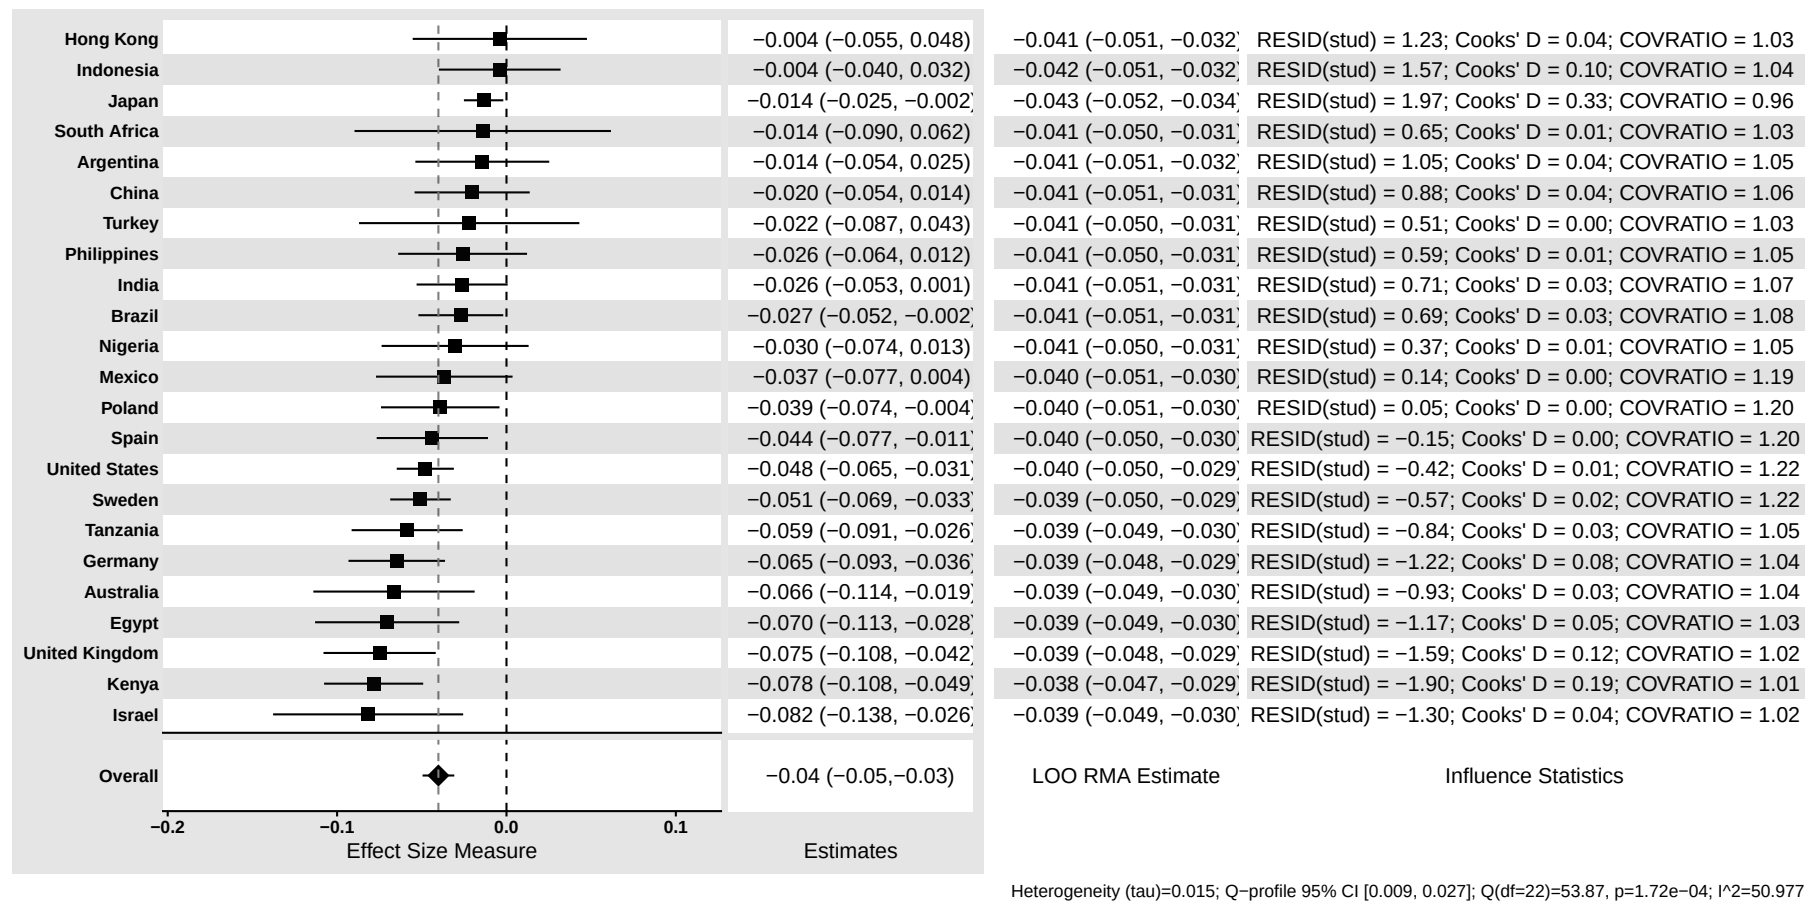

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S52. Heterogeneity in the effects of self-rated physical health at Wave 2 on secure flourishing index at Wave 3 scores across countries.

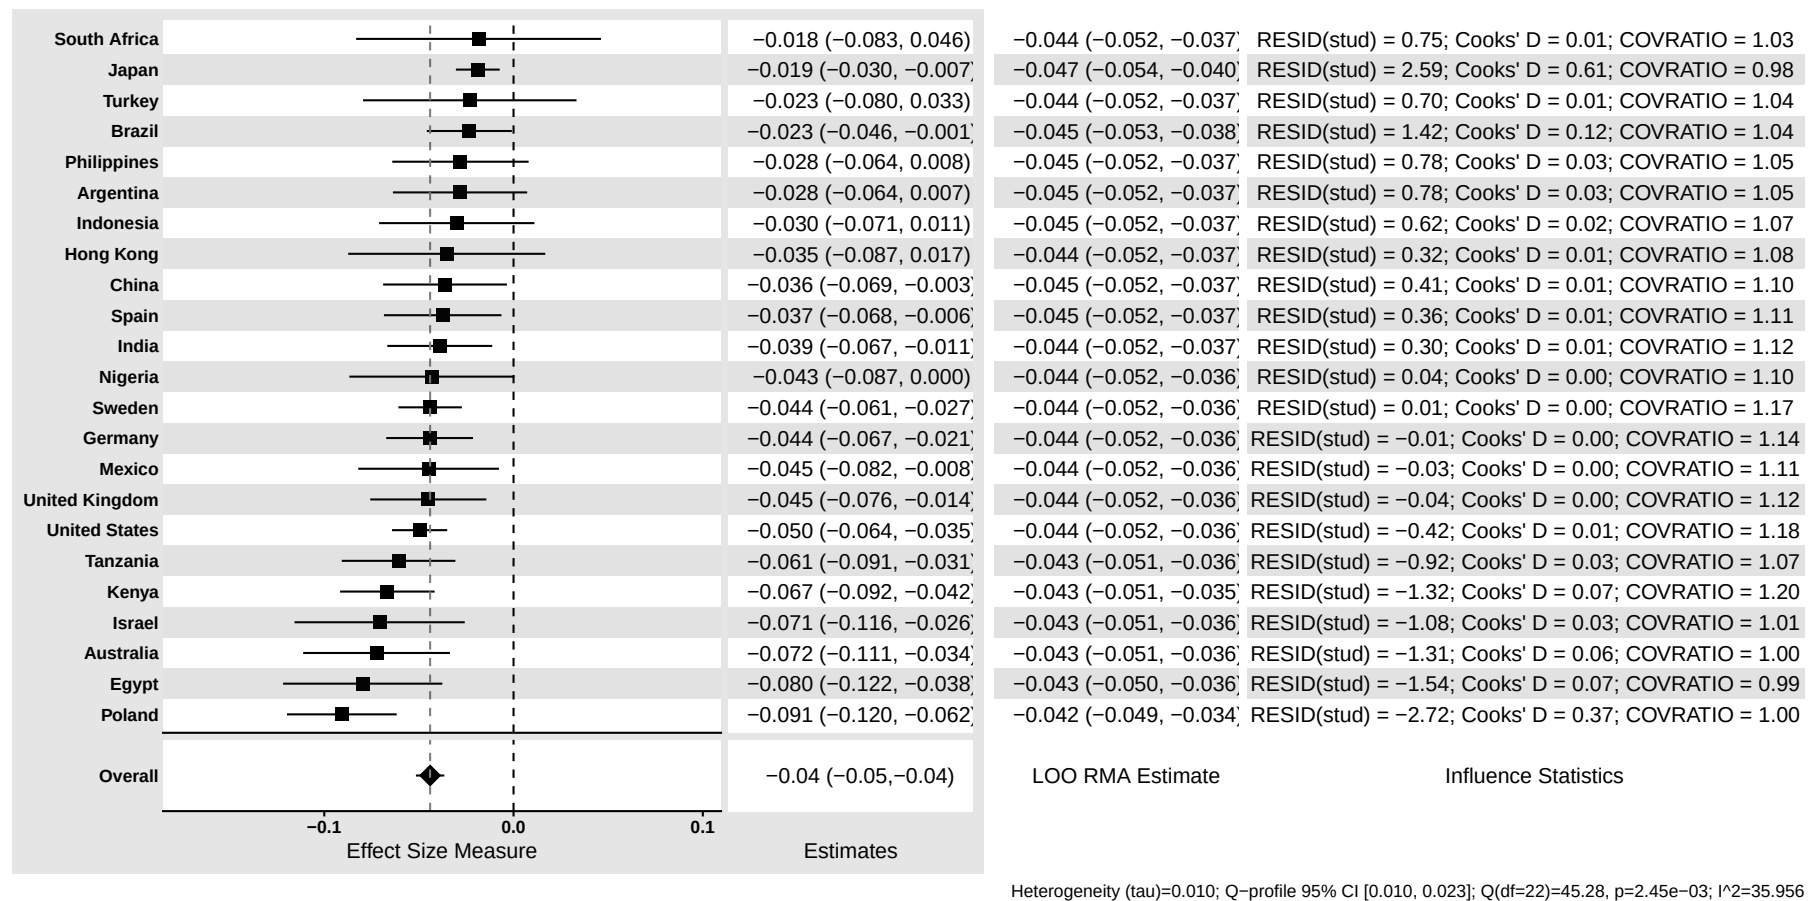

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S53. Heterogeneity in the effects of health problems at Wave 2 on secure flourishing index at Wave 3 scores across countries.

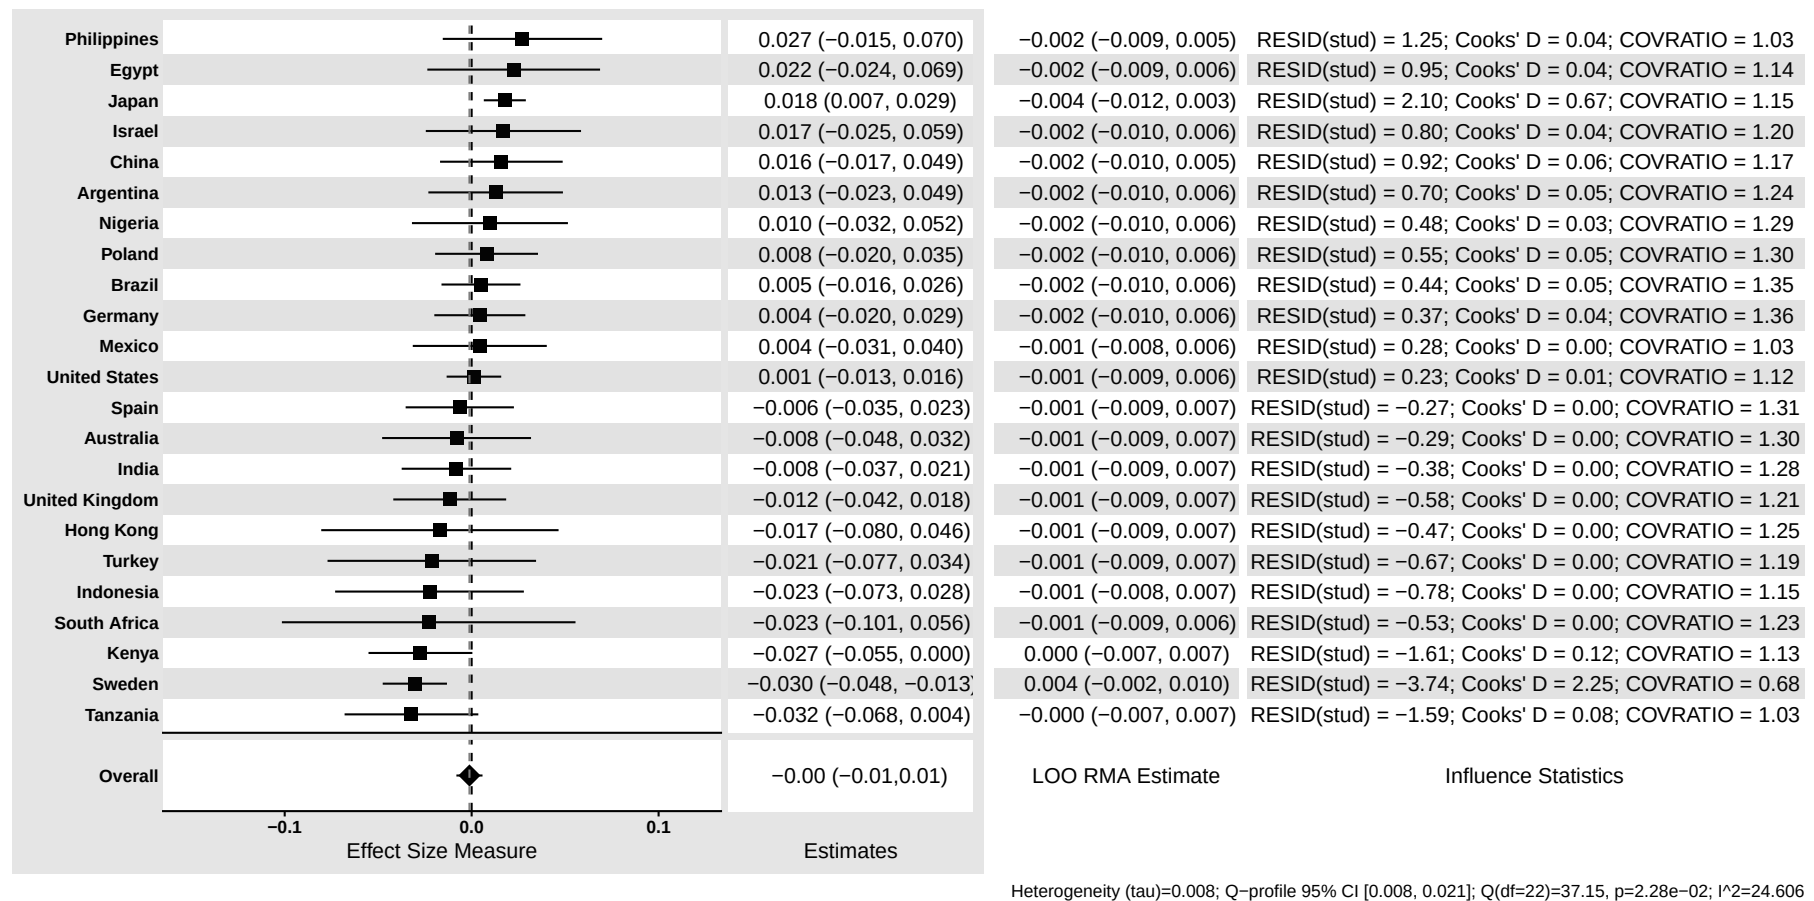

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S54. Heterogeneity in the effects of pain in past 4 weeks at Wave 2 on secure flourishing index at Wave 3 scores across countries.

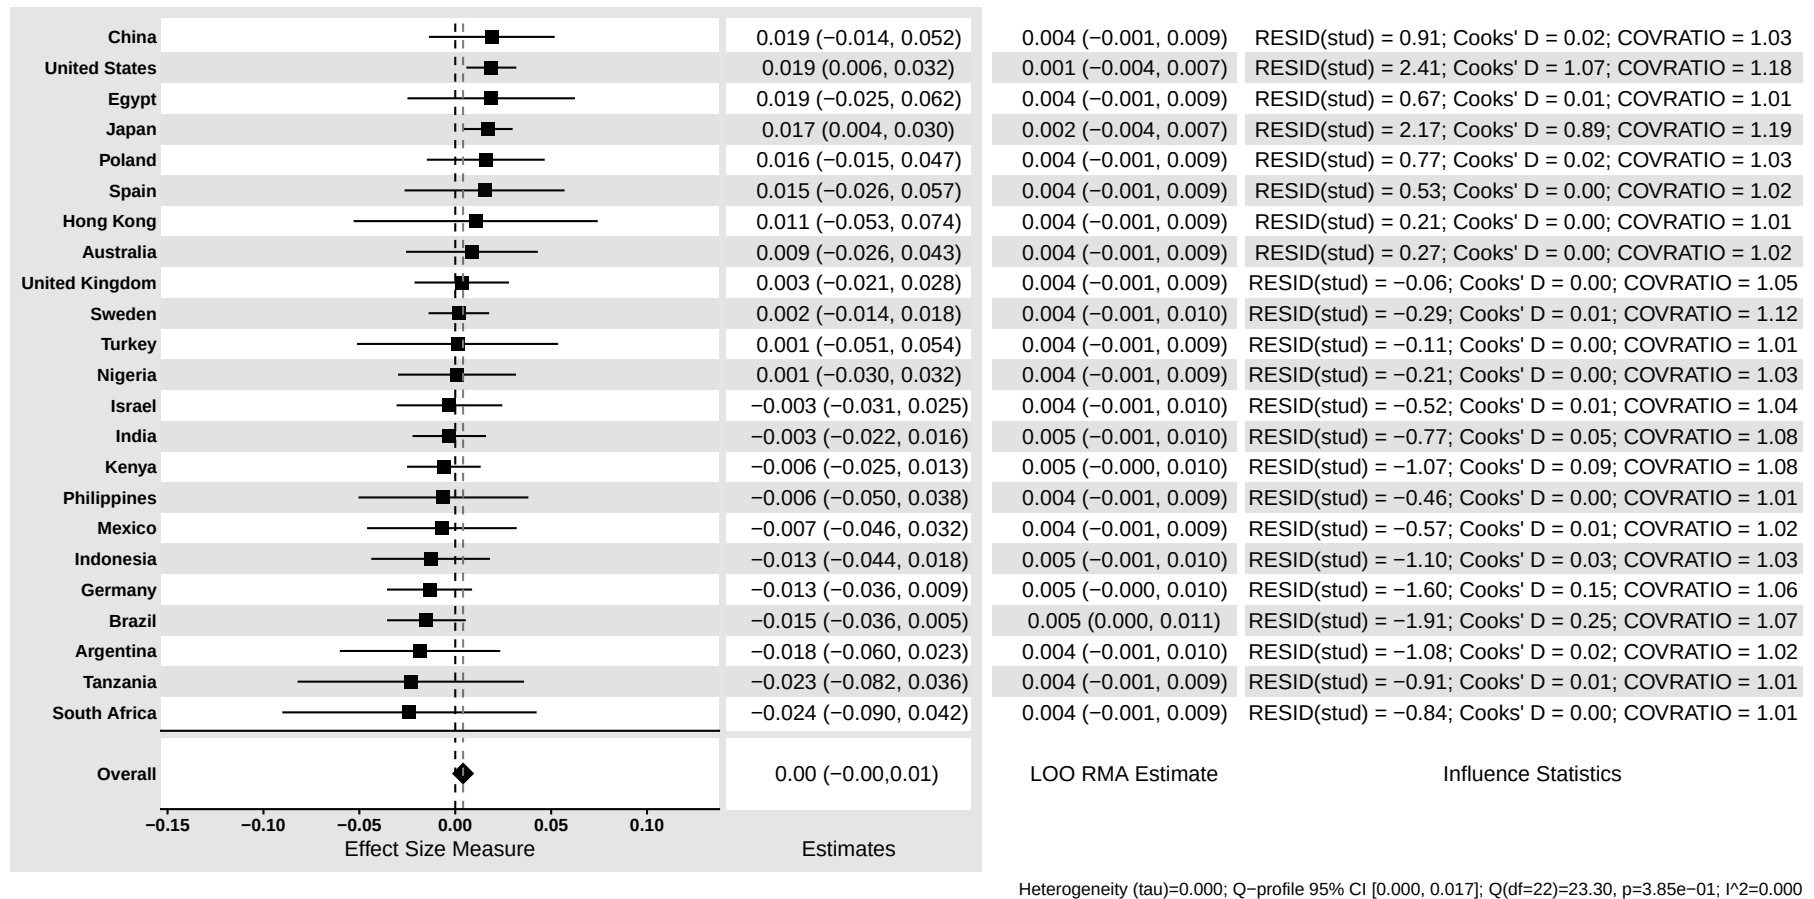

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. No adjustments were made for multiple testing.

Figure S55. Heterogeneity in the effects of daily smoker at Wave 2 on secure flourishing index at Wave 3 scores across countries.

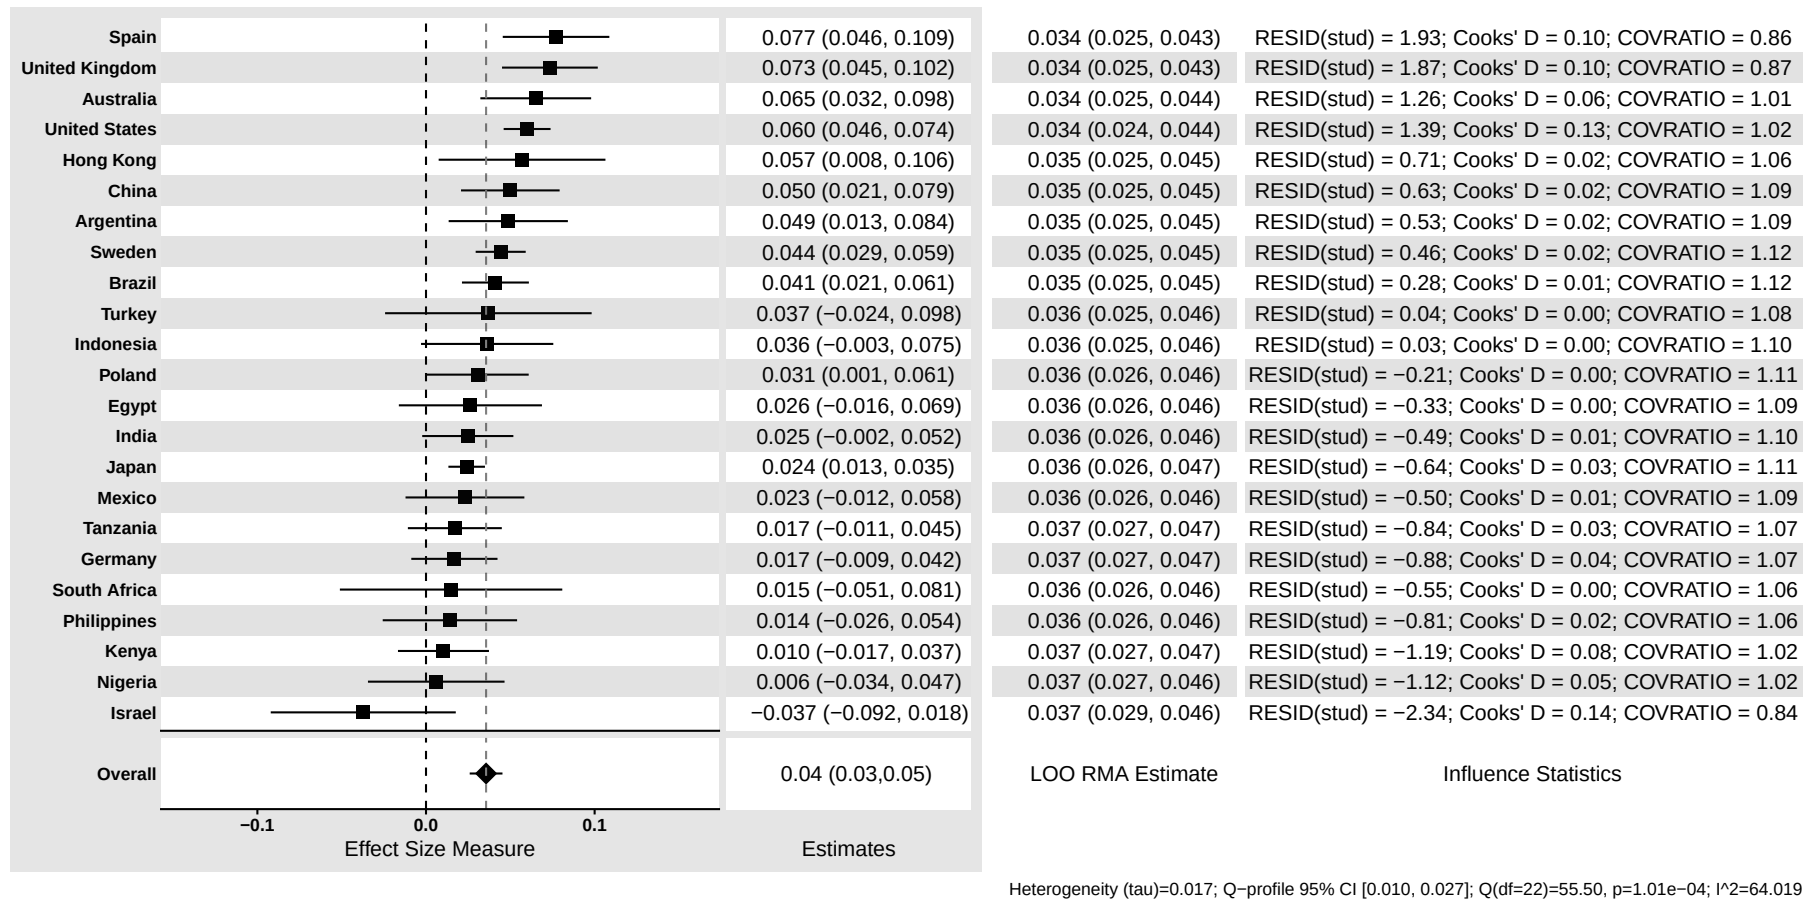

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S56. Heterogeneity in the effects of number of drinks per week at Wave 2 on secure flourishing index at Wave 3 scores across countries.

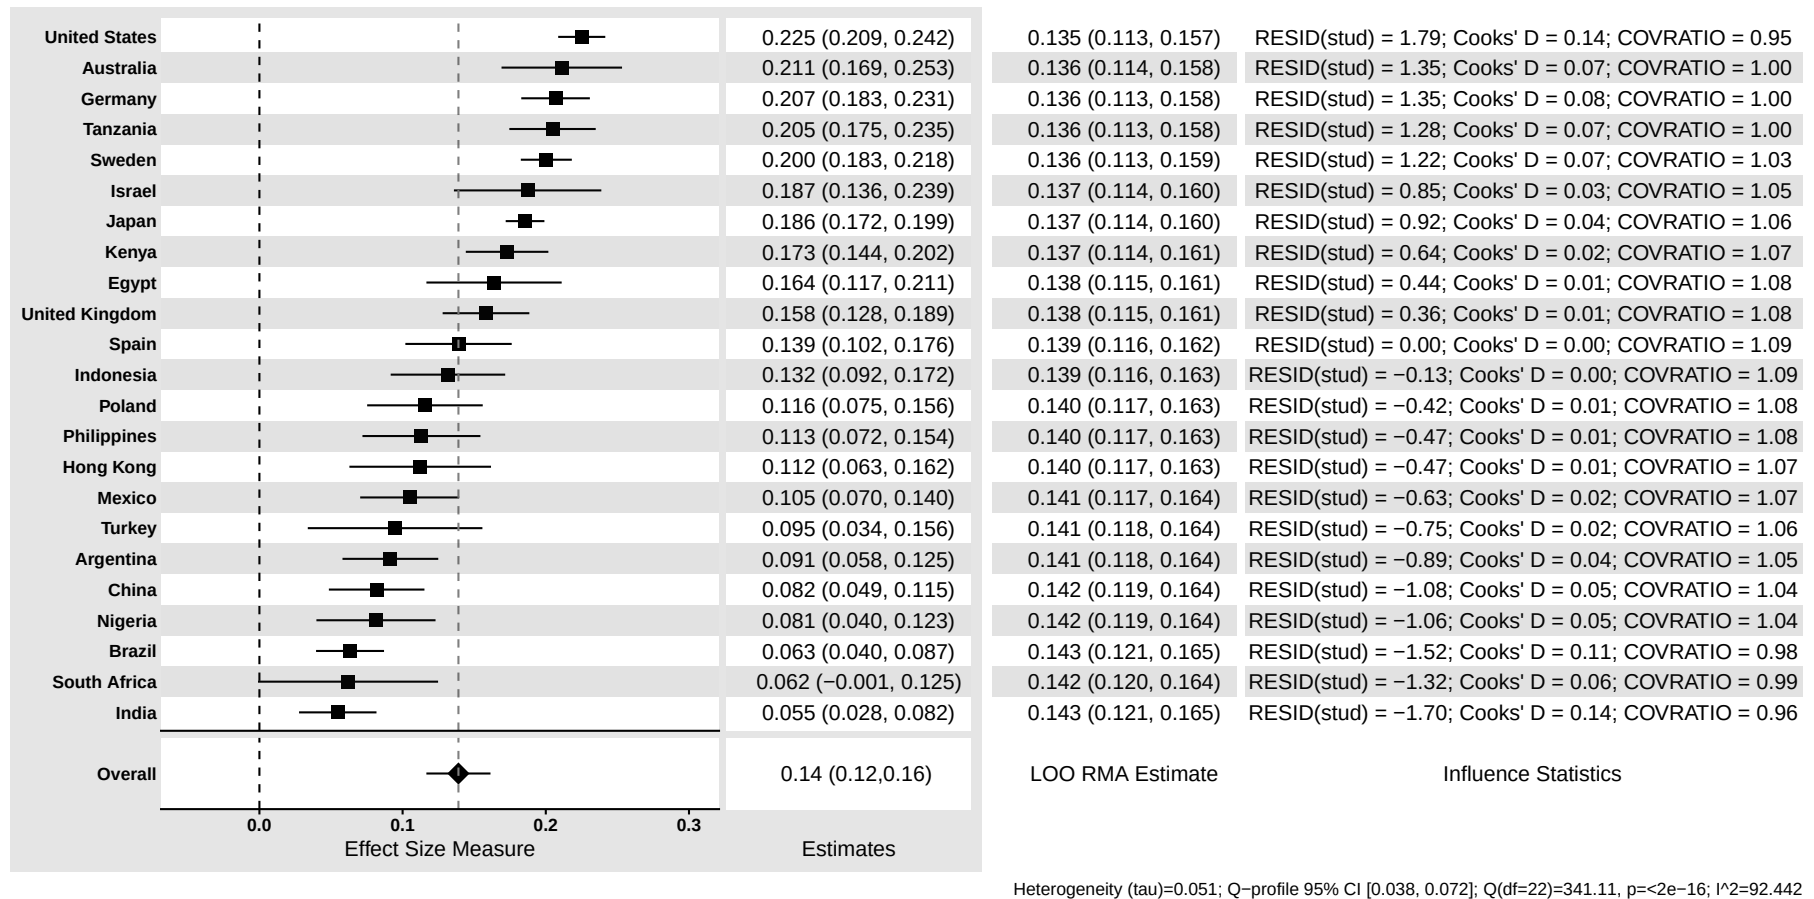

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S57. Heterogeneity in the effects of days exercise per week at Wave 2 on secure flourishing index at Wave 3 scores across countries.

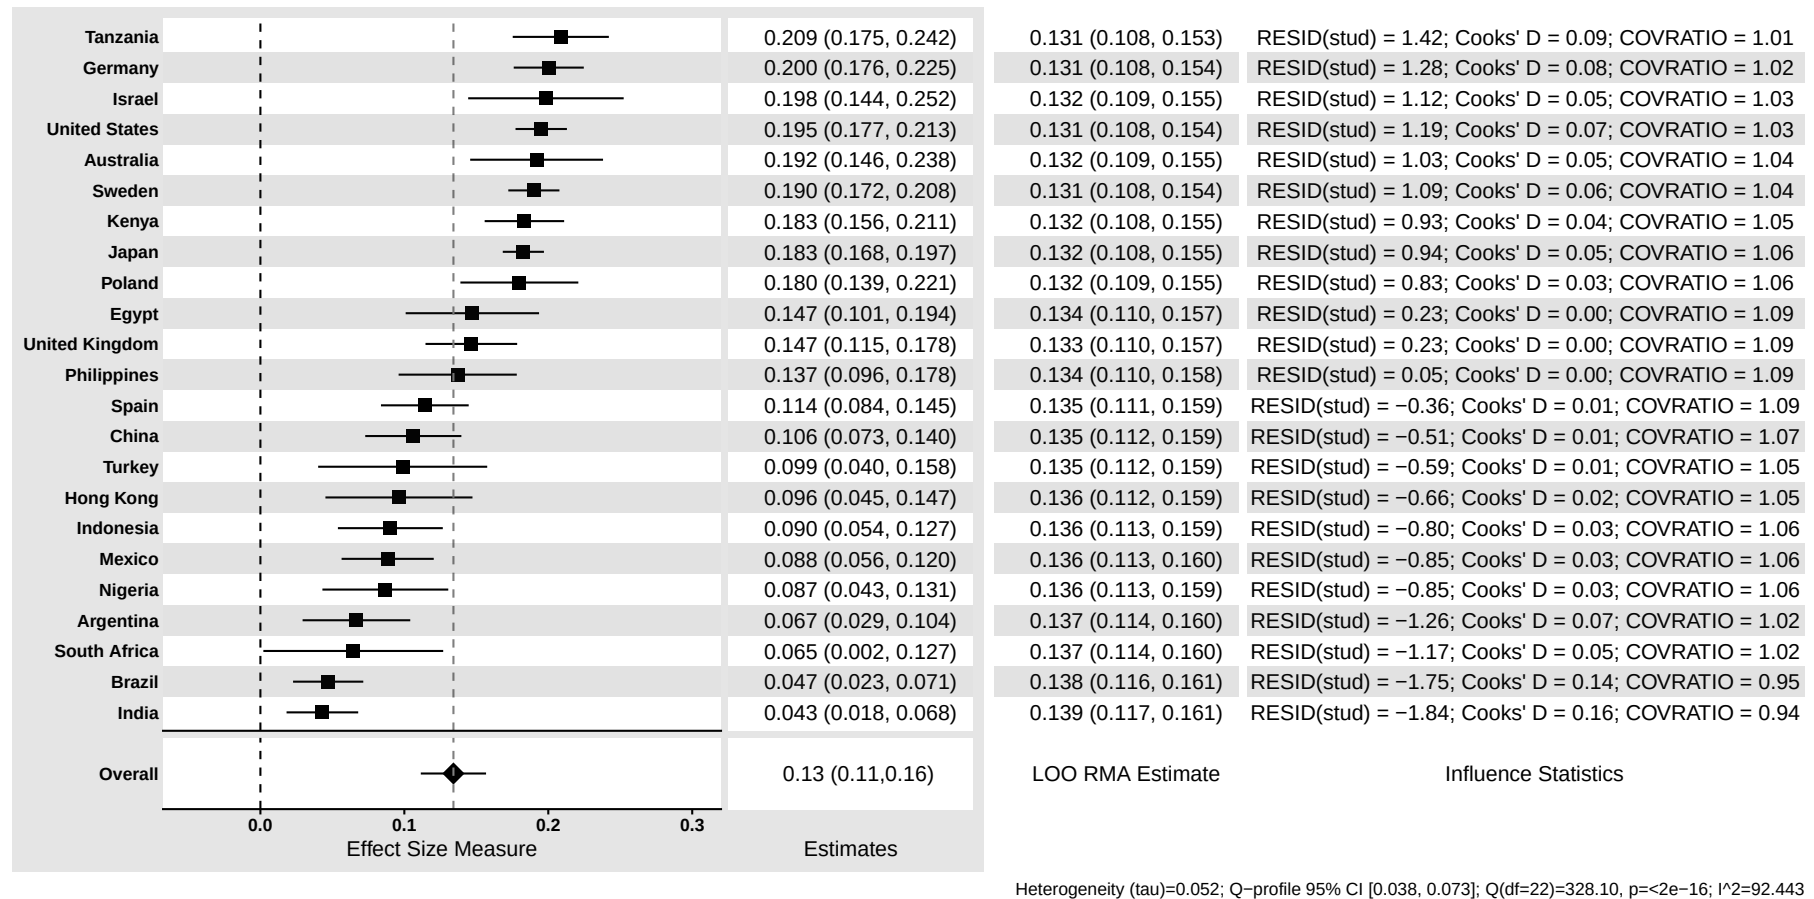

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S58. Heterogeneity in the effects of financial security at Wave 2 on secure flourishing index at Wave 3 scores across countries.

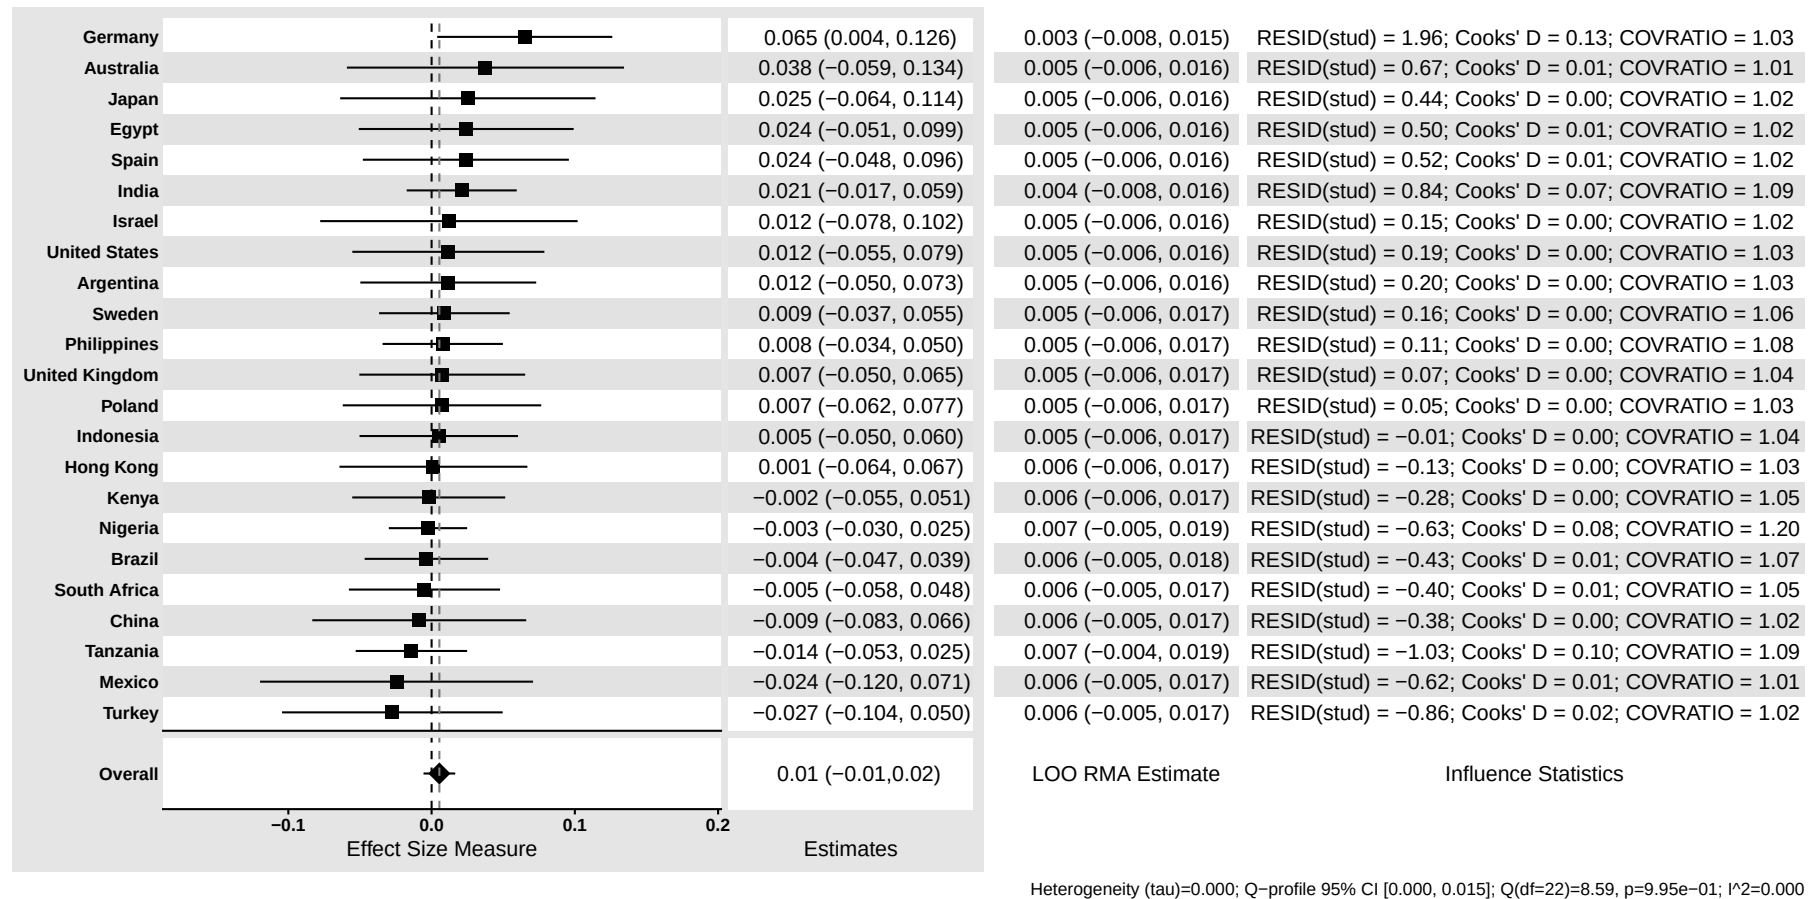

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S59. Heterogeneity in the effects of material security at Wave 2 on secure flourishing index at Wave 3 scores across countries.

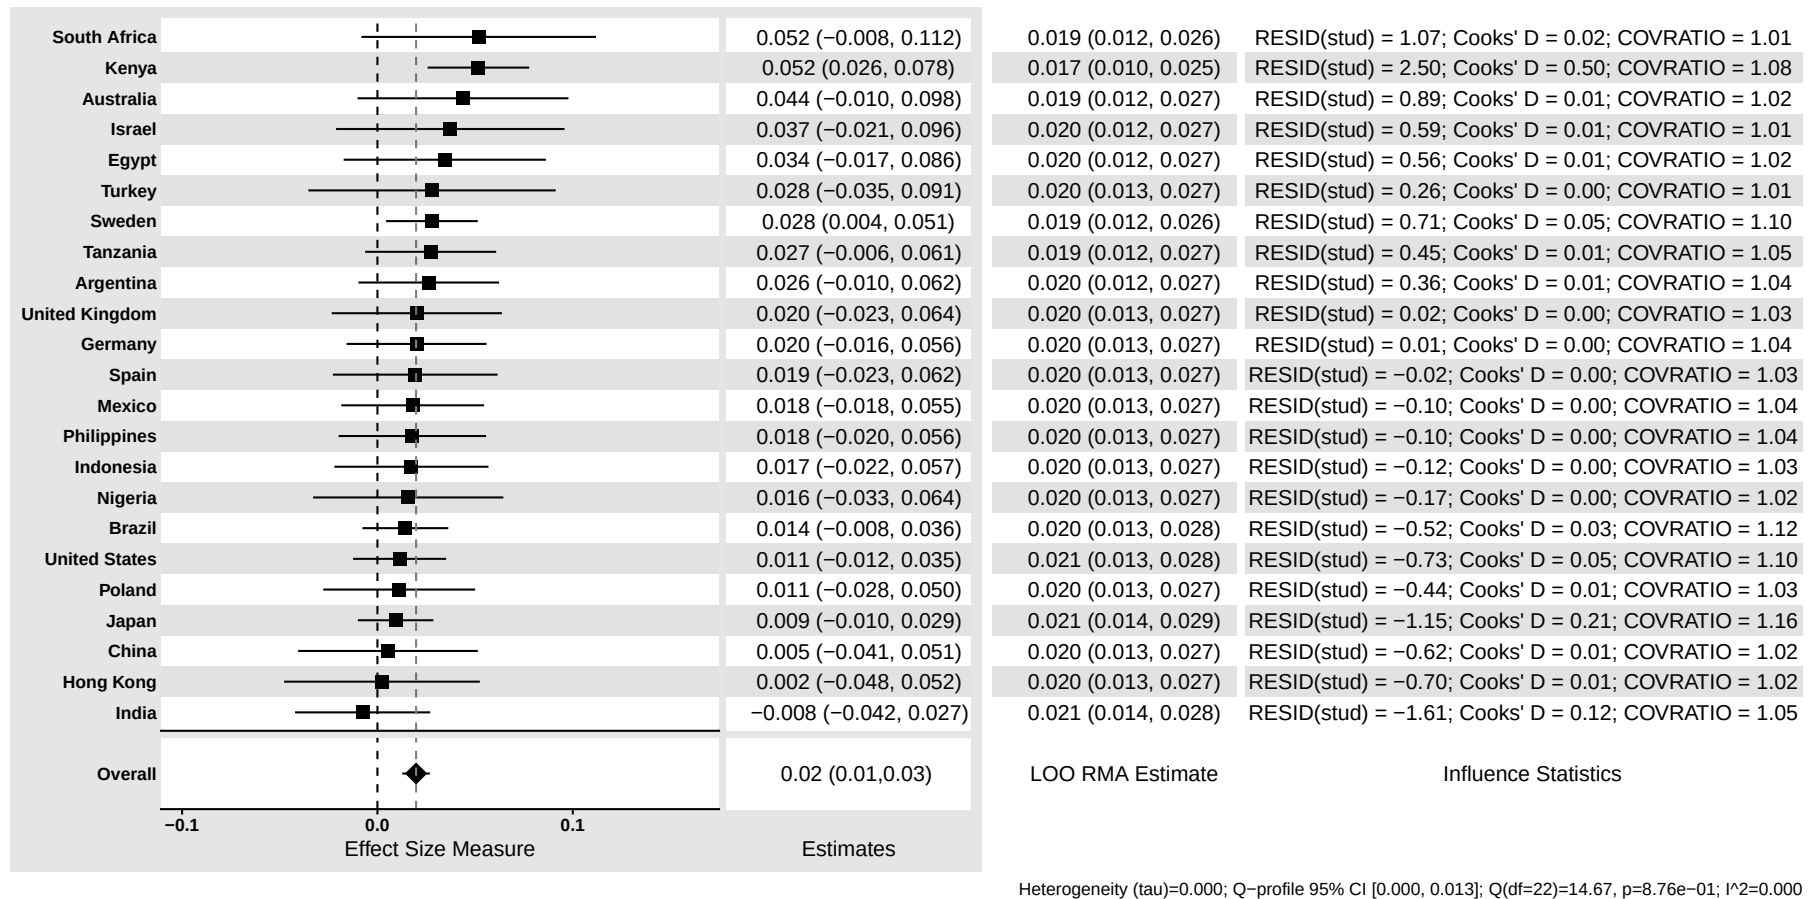

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S60. Heterogeneity in the effects of educational attainment (16+ years) at Wave 2 on secure flourishing index at Wave 3 scores across countries.

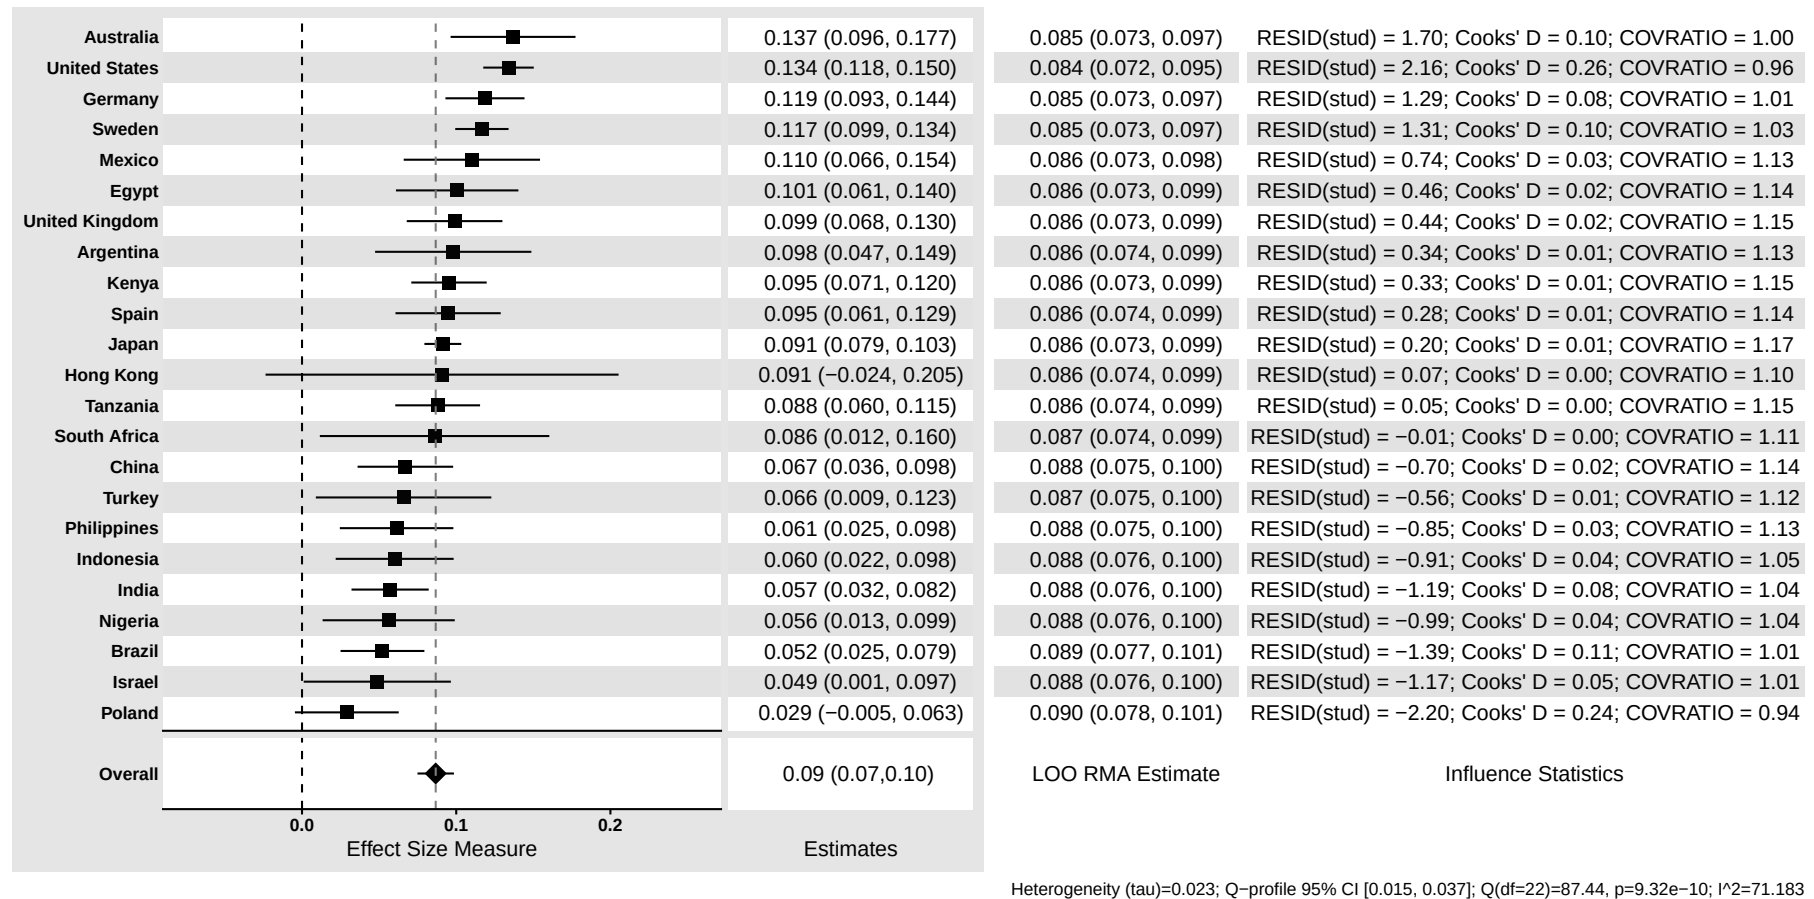

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S61. Heterogeneity in the effects of currently employed at Wave 2 on secure flourishing index at Wave 3 scores across countries.

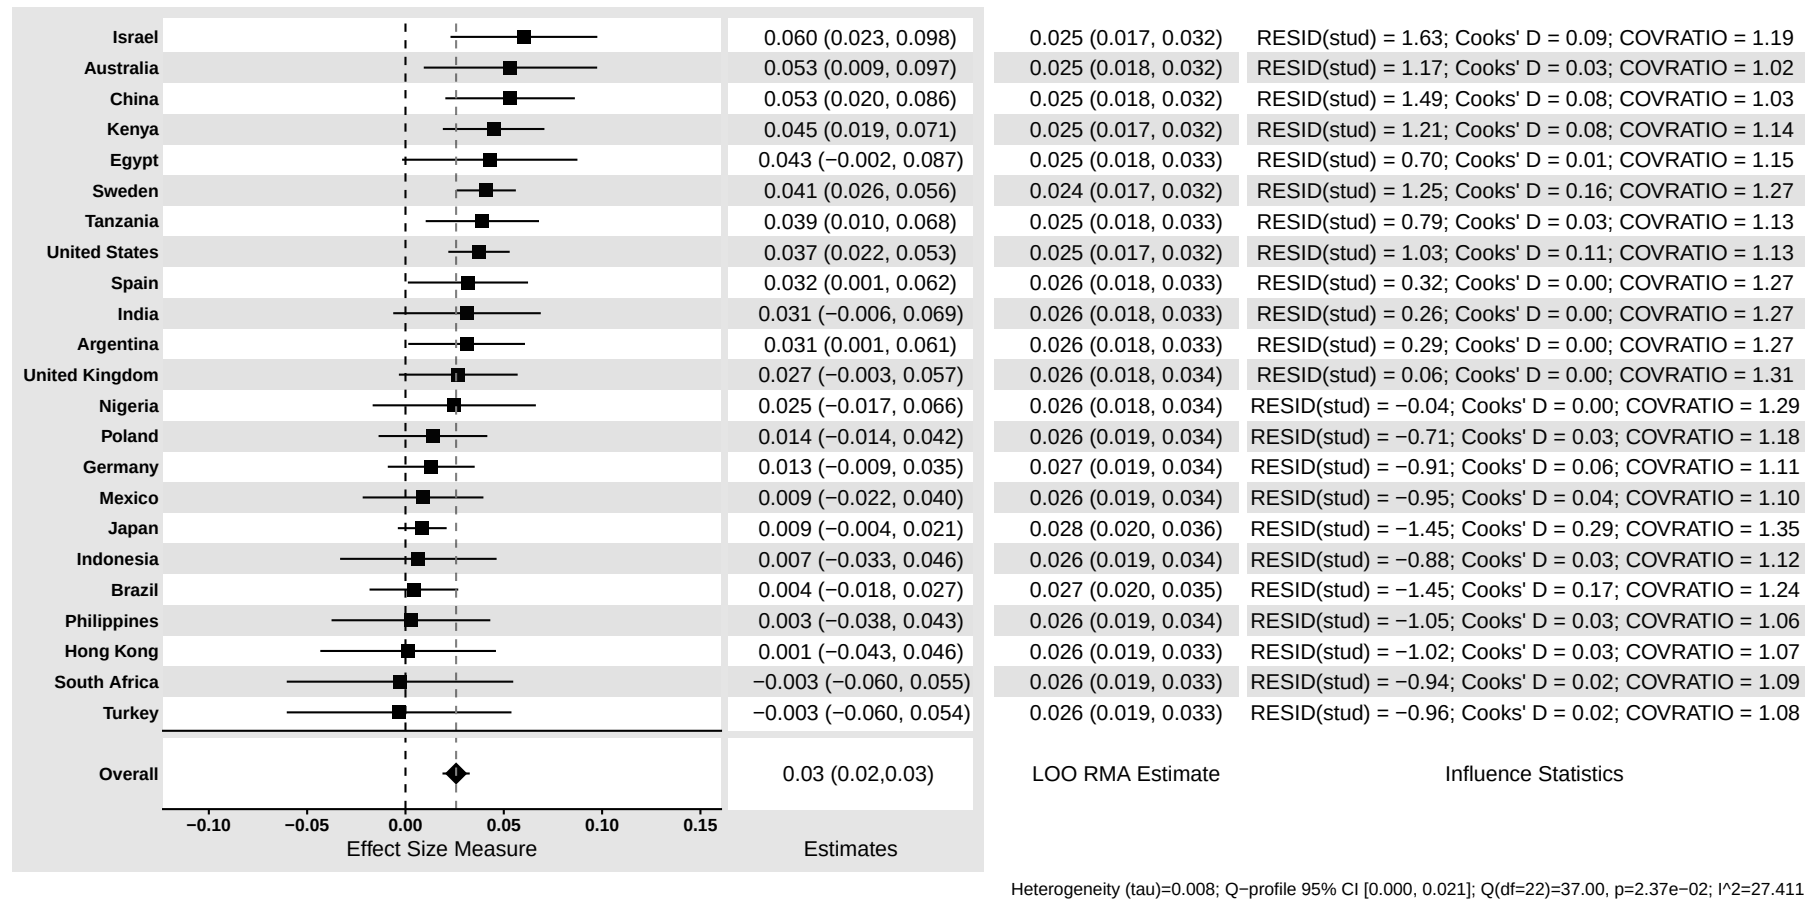

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S62. Heterogeneity in the effects of financially comfortable/getting by at Wave 2 on secure flourishing index at Wave 3 scores across countries.

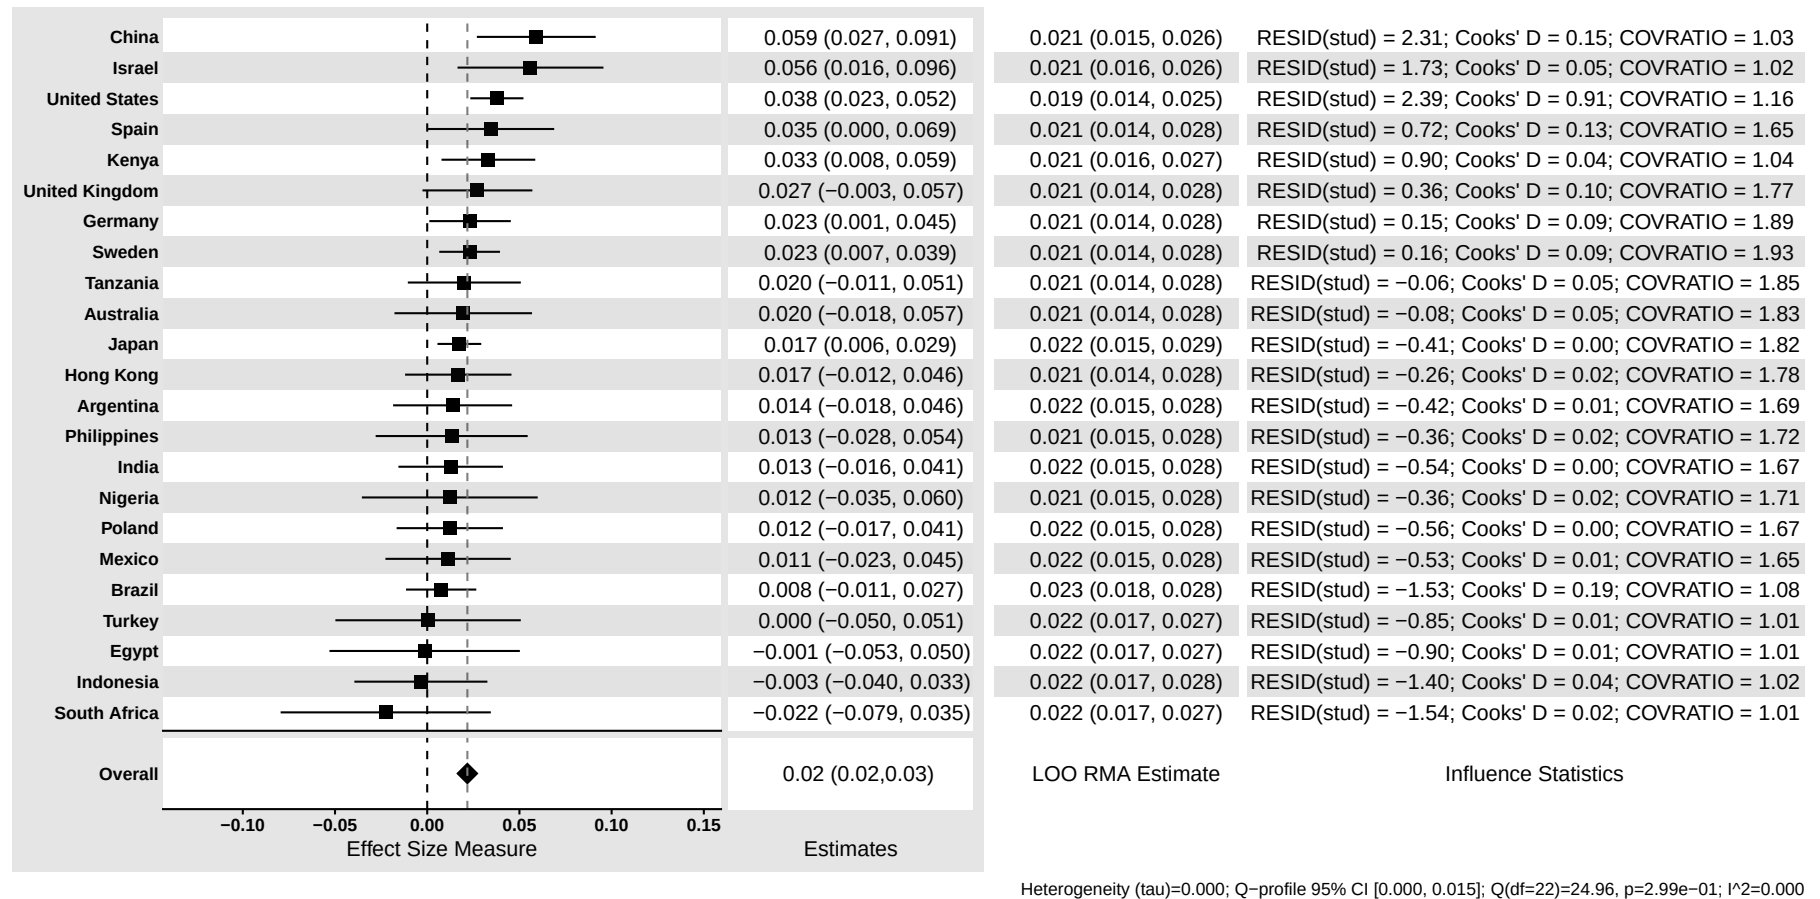

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S63. Heterogeneity in the effects of own home at Wave 2 on secure flourishing index at Wave 3 scores across countries.

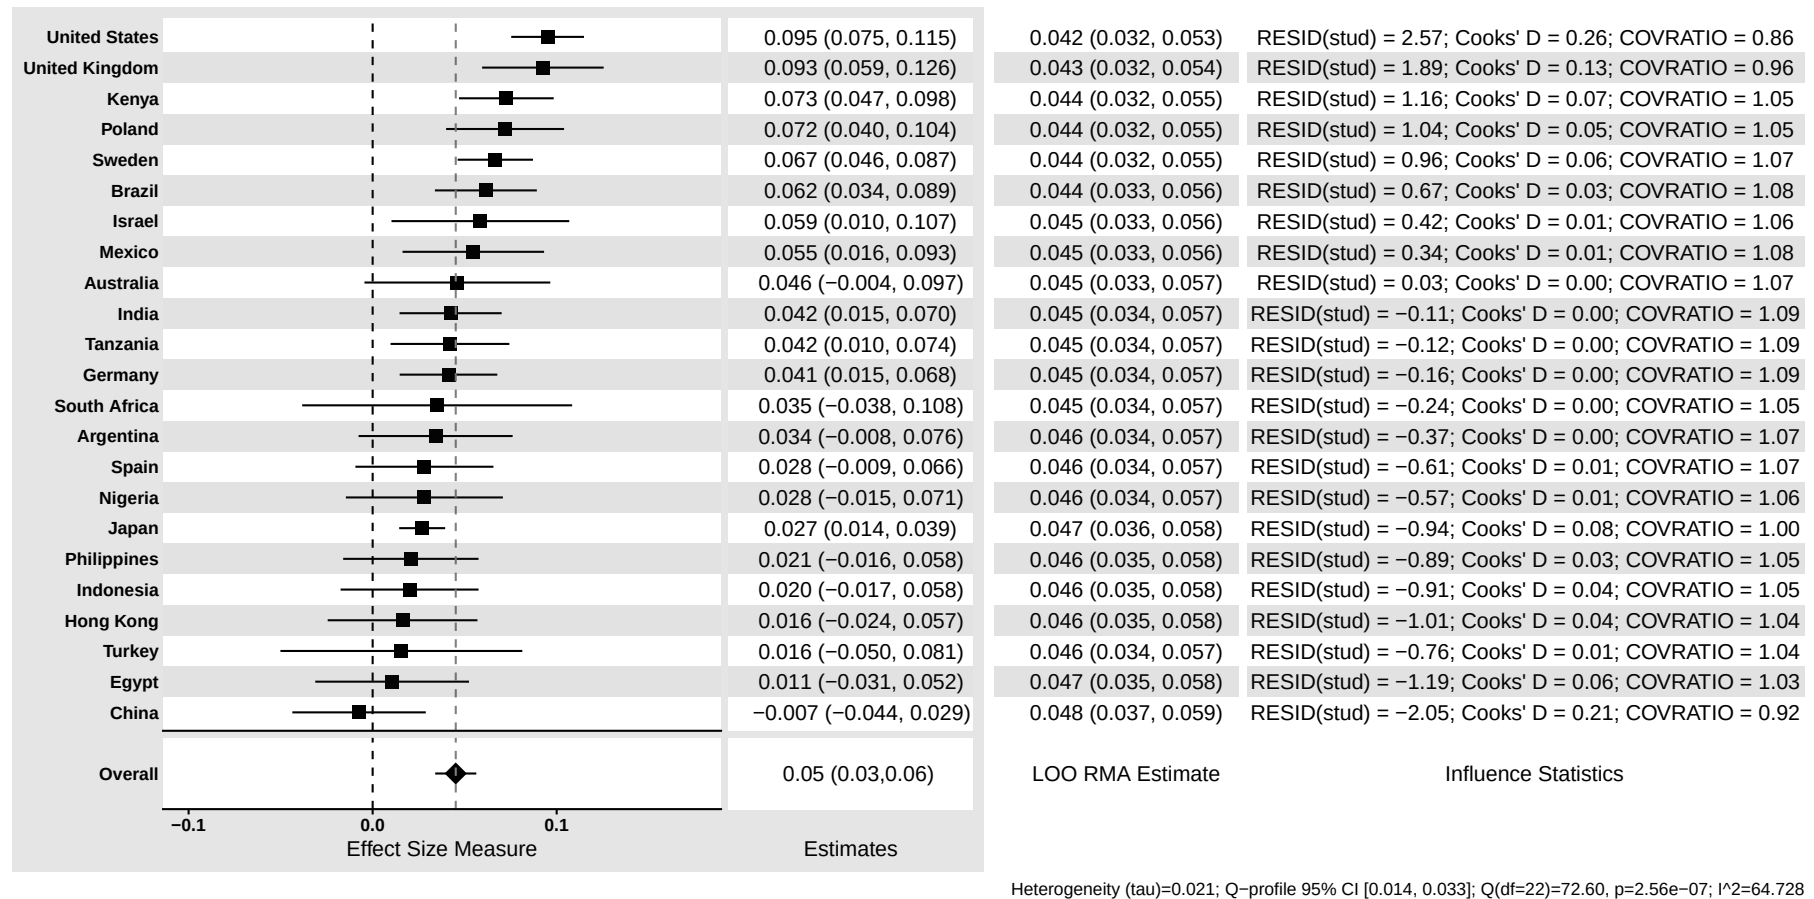

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S64. Heterogeneity in the effects of income – top quintile at Wave 2 on secure flourishing index at Wave 3 scores across countries.

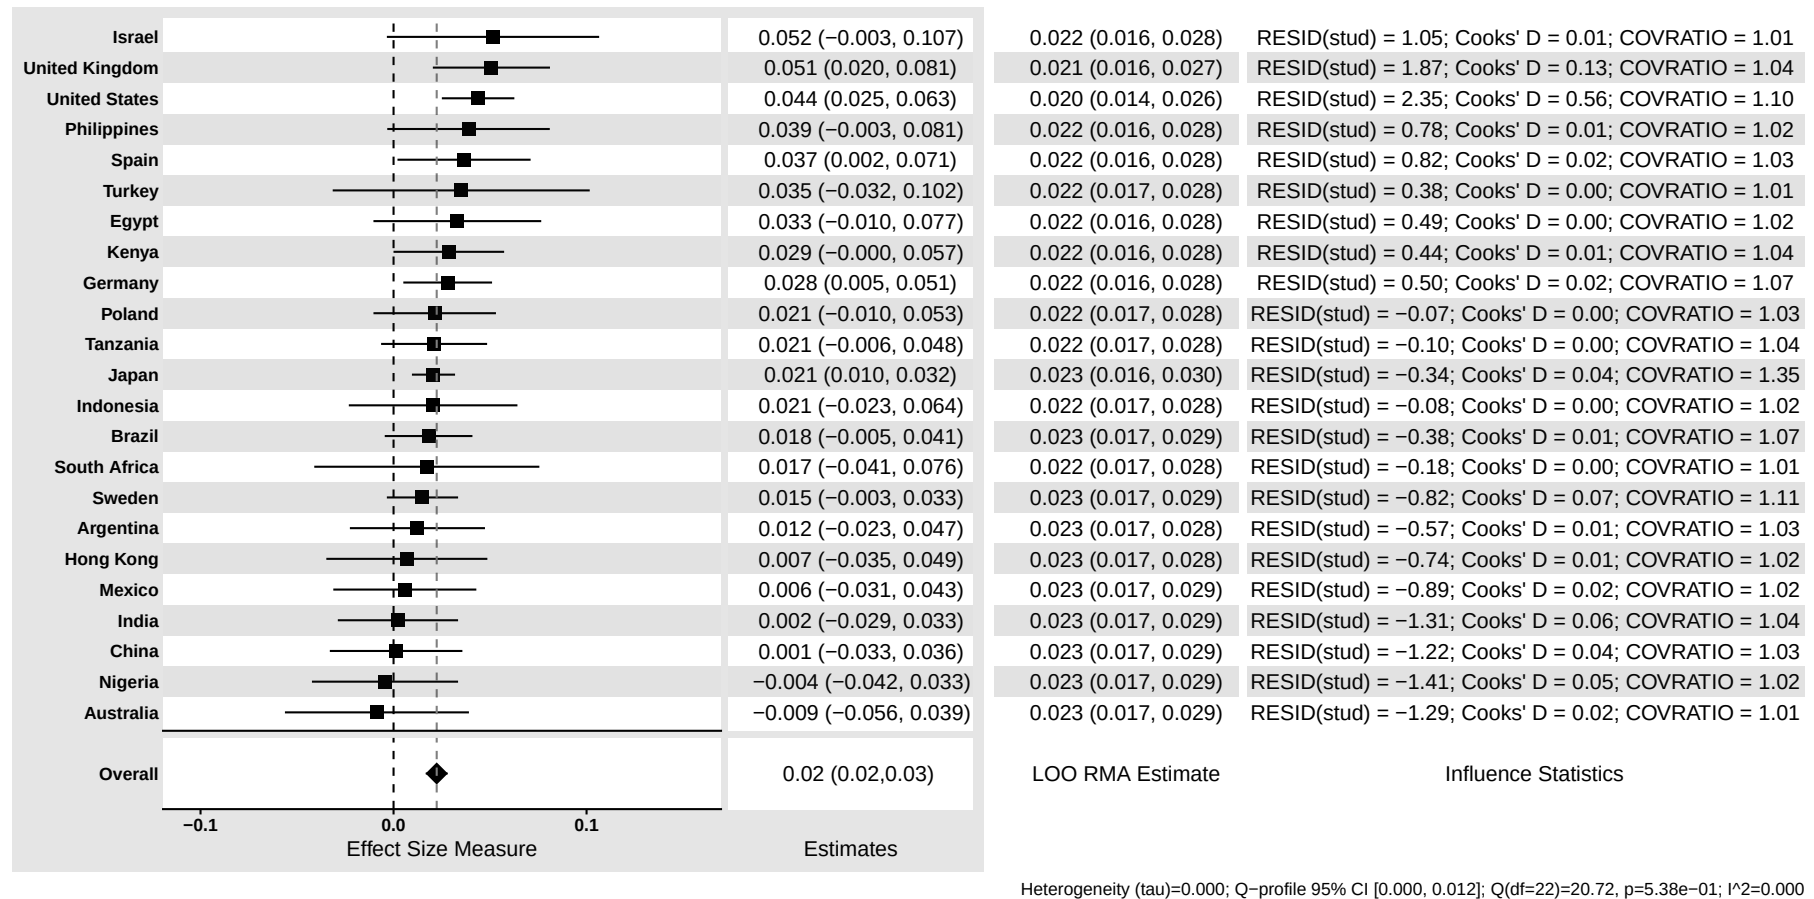

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S65. Heterogeneity in the effects of religious/spiritual connection at Wave 2 on secure flourishing index at Wave 3 scores across countries.

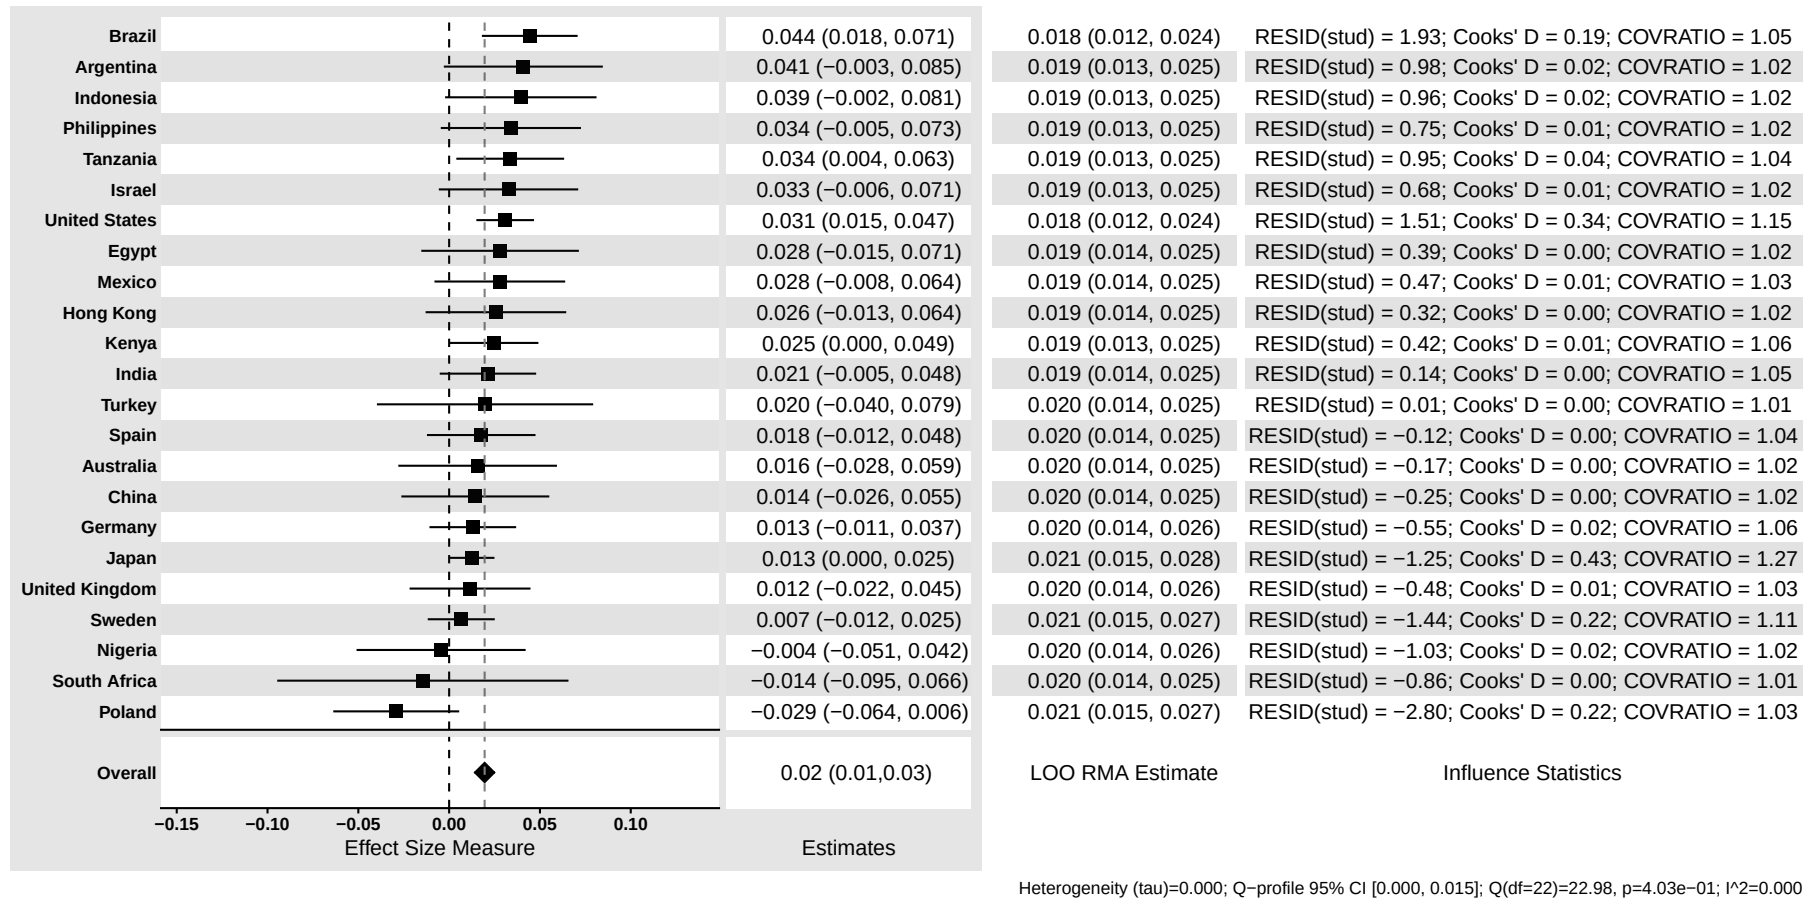

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S66. Heterogeneity in the effects of belief in life after death at Wave 2 on secure flourishing index at Wave 3 scores across countries.

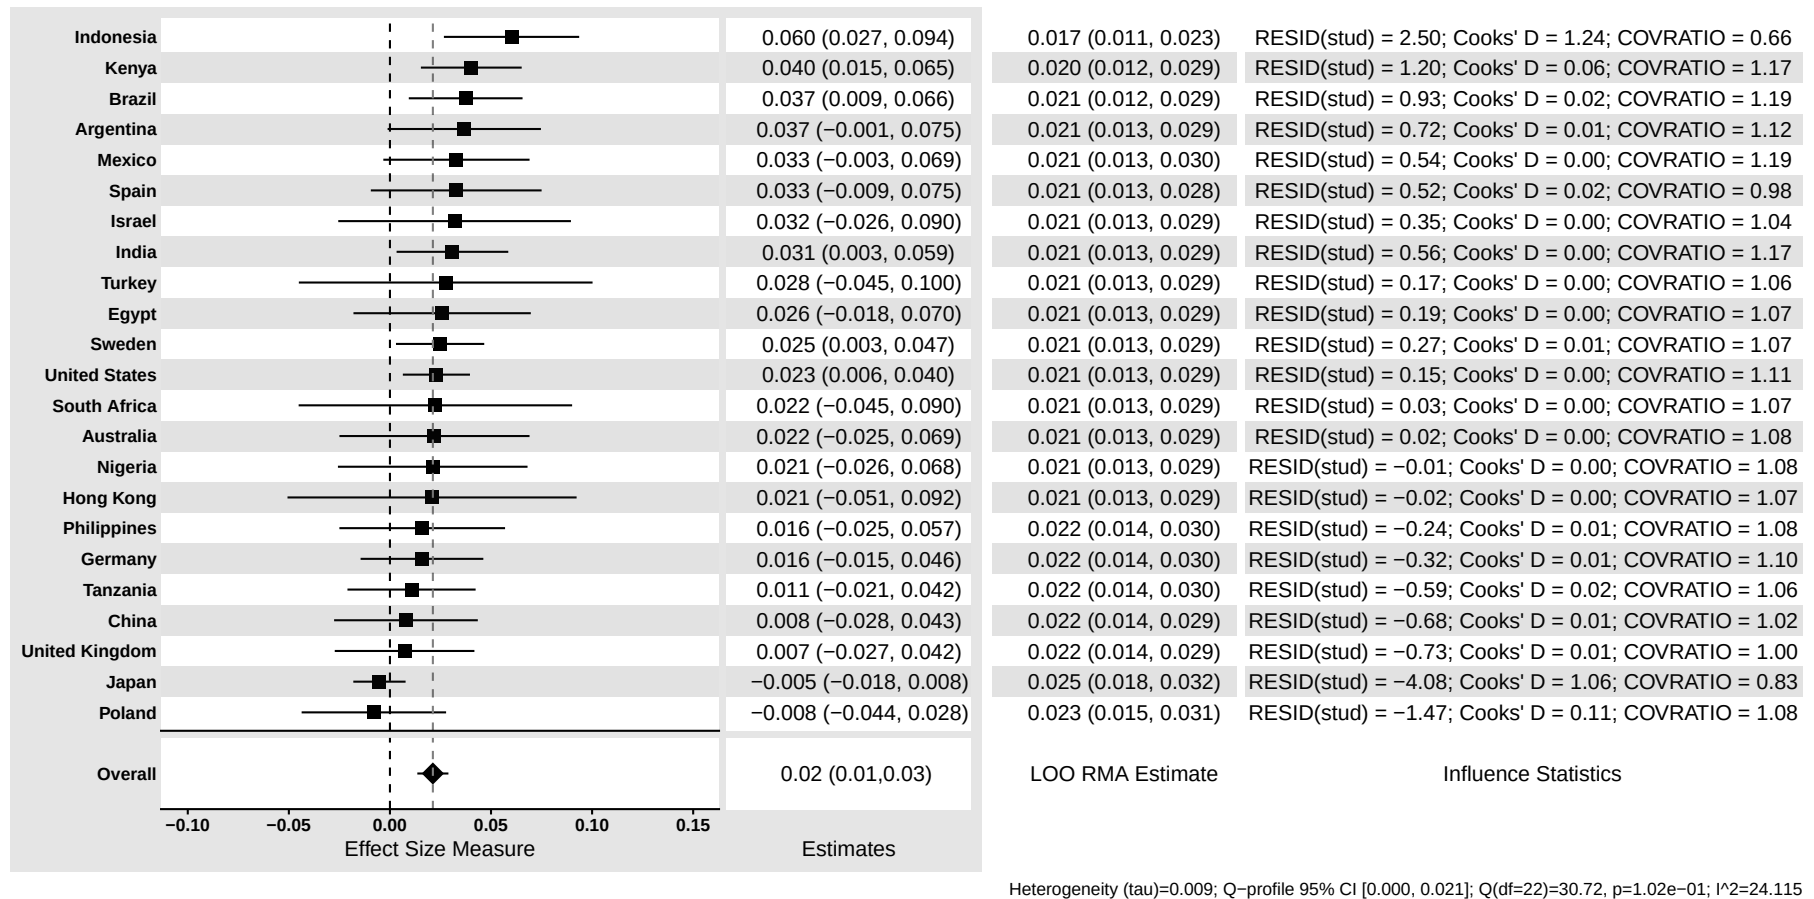

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S67. Heterogeneity in the effects of transformative religious experience at Wave 2 on secure flourishing index at Wave 3 scores across countries.

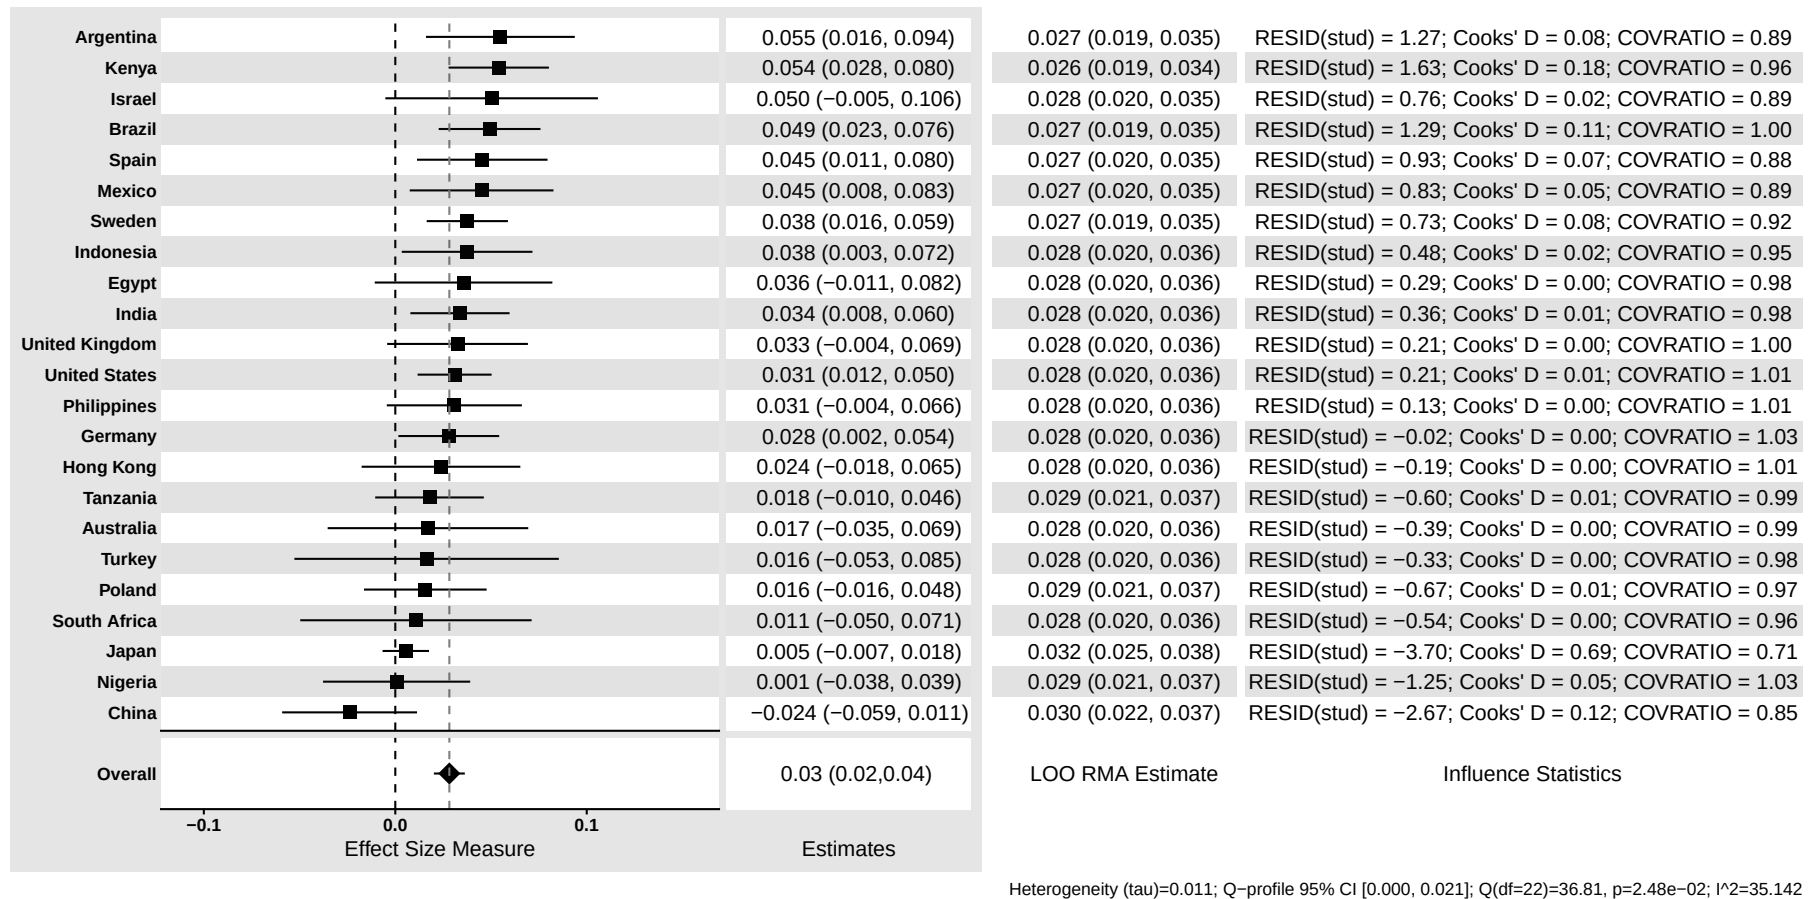

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S68. Heterogeneity in the effects of religious reading or listening at Wave 2 on secure flourishing index at Wave 3 scores across countries.

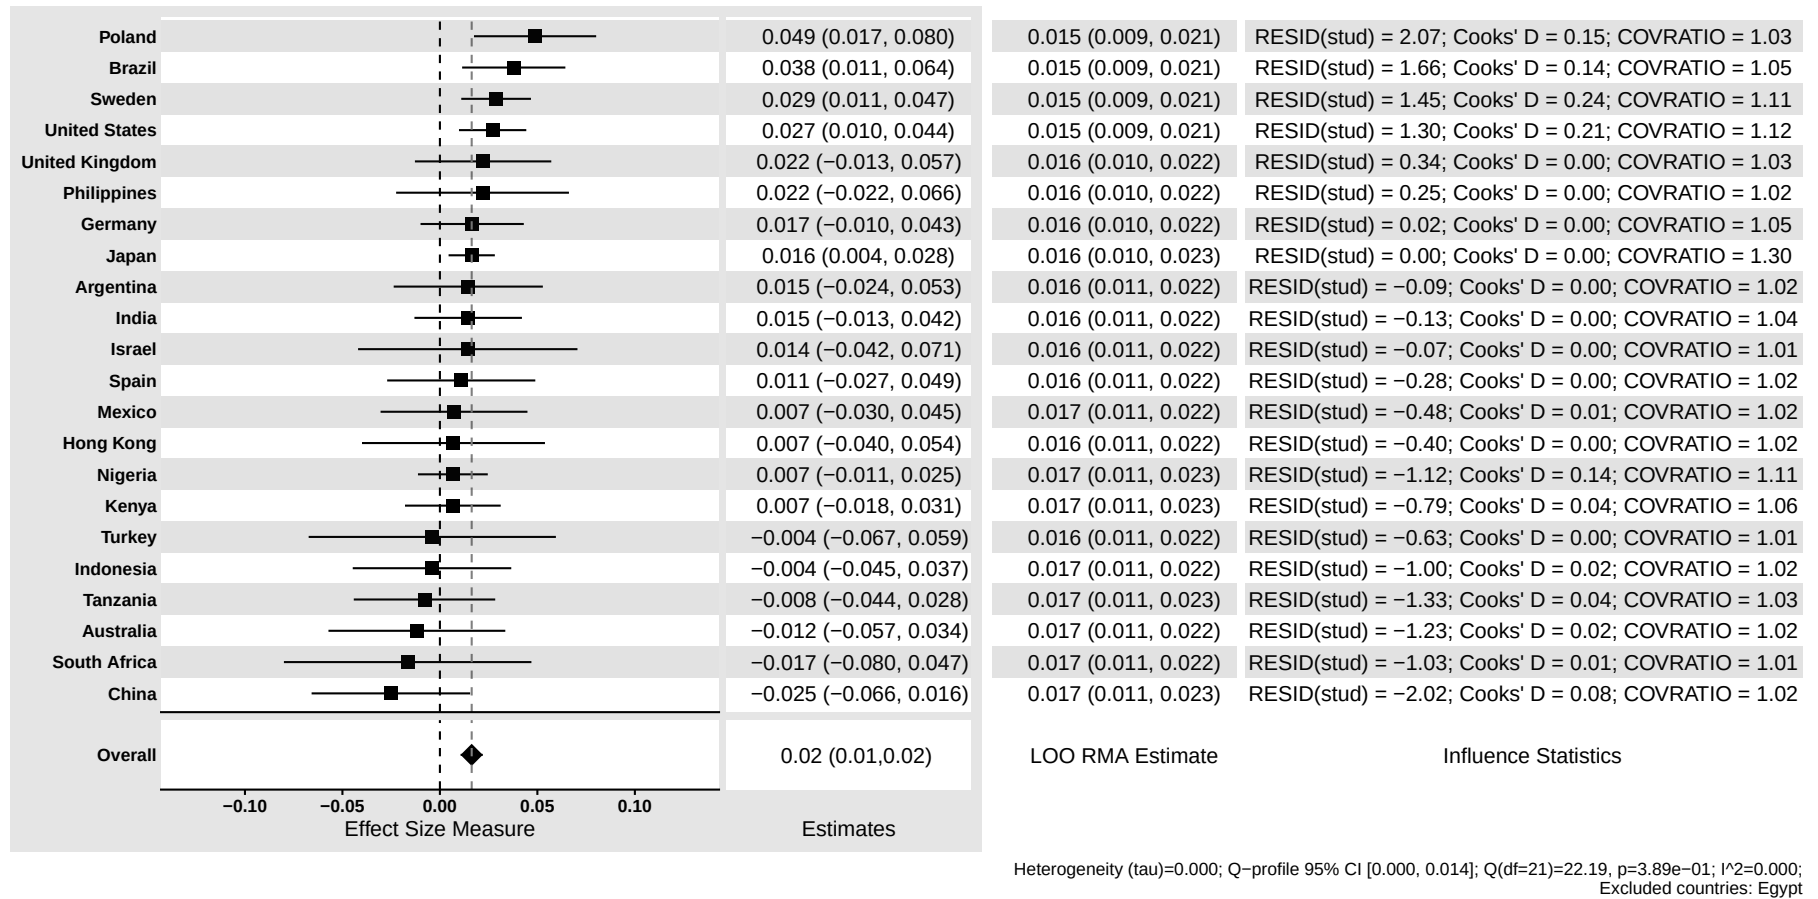

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S69. Heterogeneity in the effects of prayer or meditation at Wave 2 on secure flourishing index at Wave 3 scores across countries.

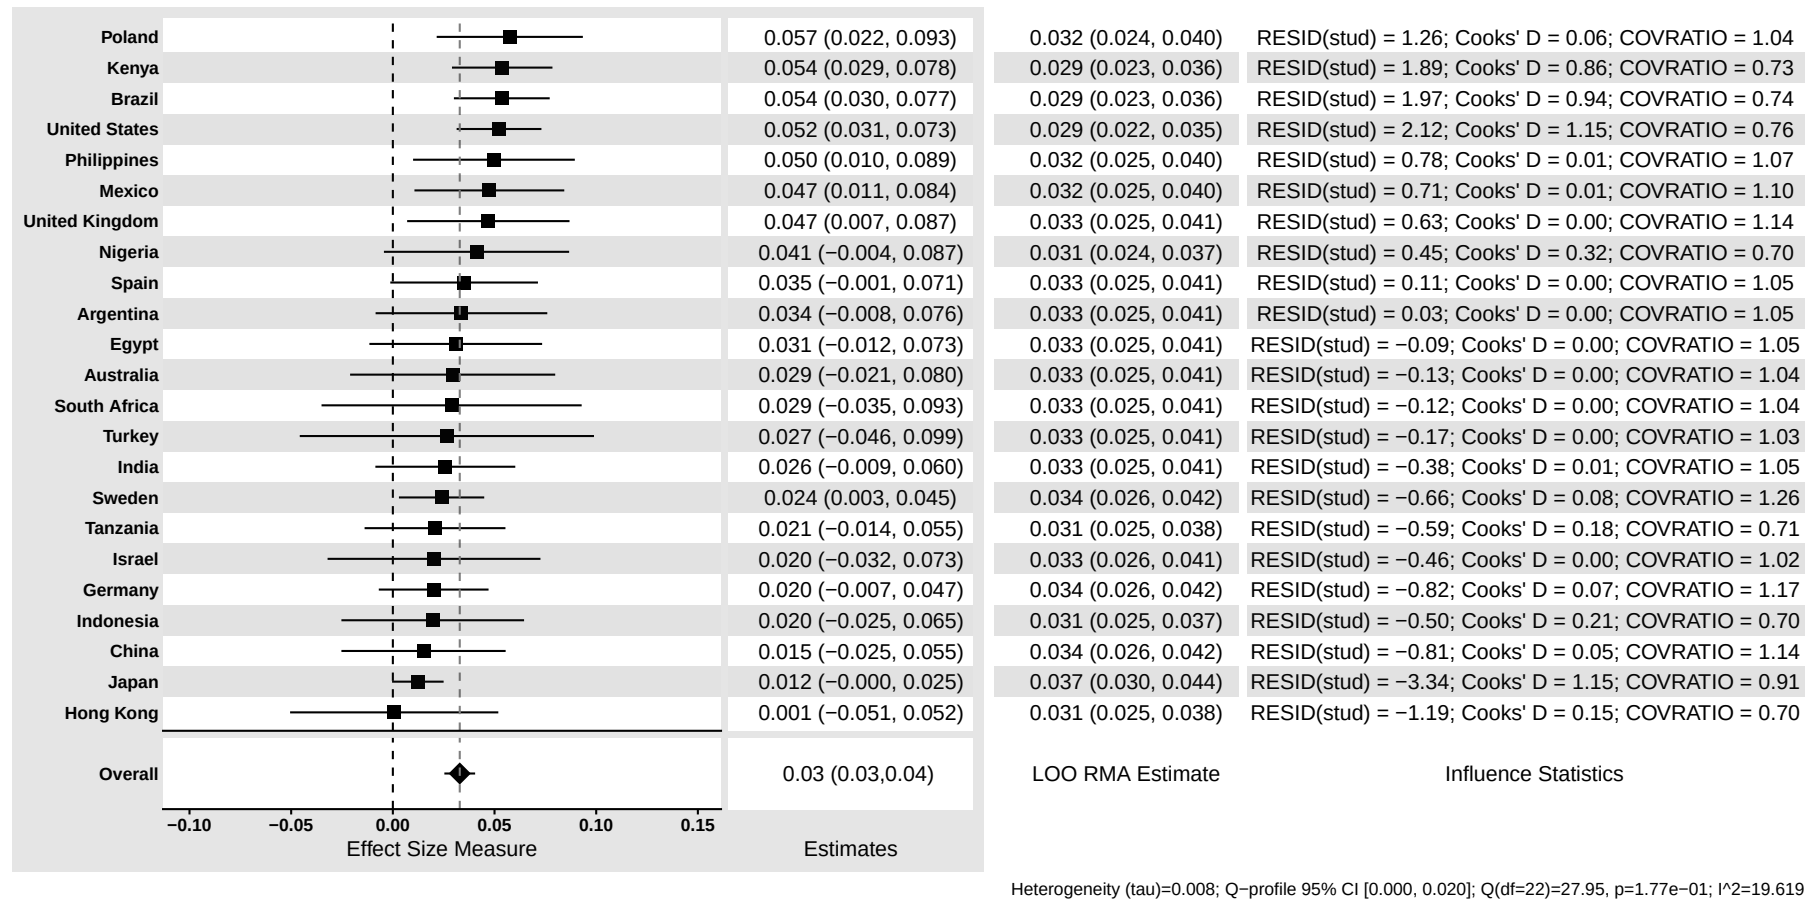

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S70. Heterogeneity in the effects of belief in god/gods/spiritual forces at Wave 2 on secure flourishing index at Wave 3 scores across countries.

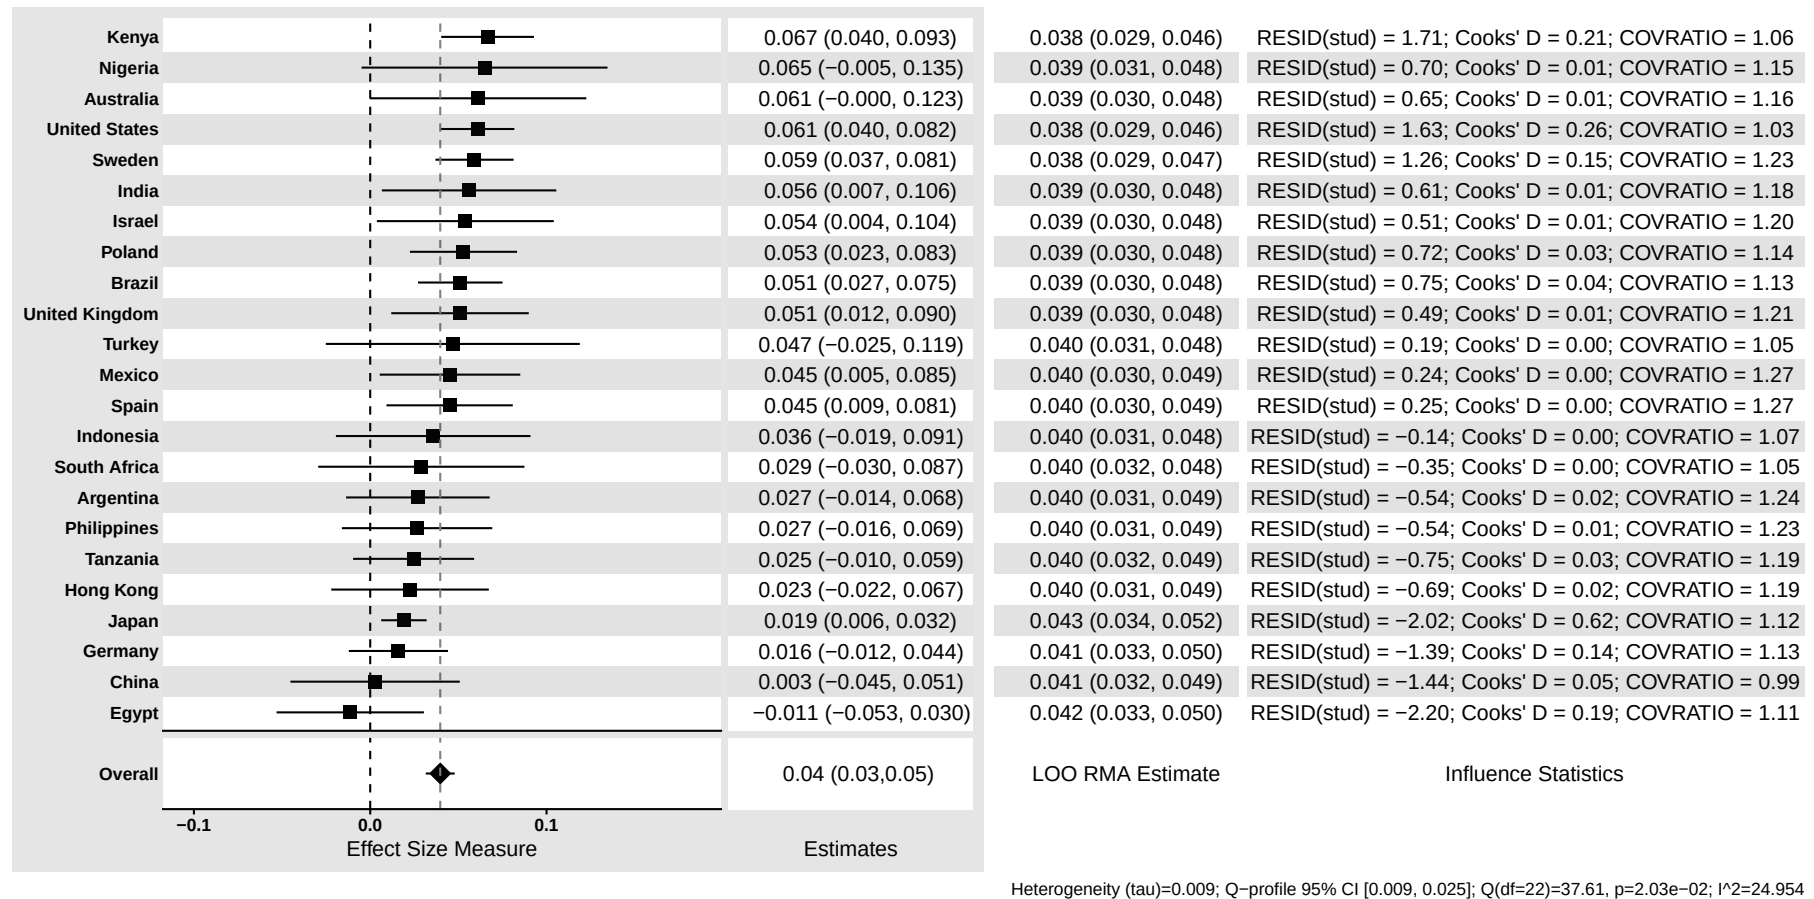

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S71. Heterogeneity in the effects of religious centrality at Wave 2 on secure flourishing index at Wave 3 scores across countries.

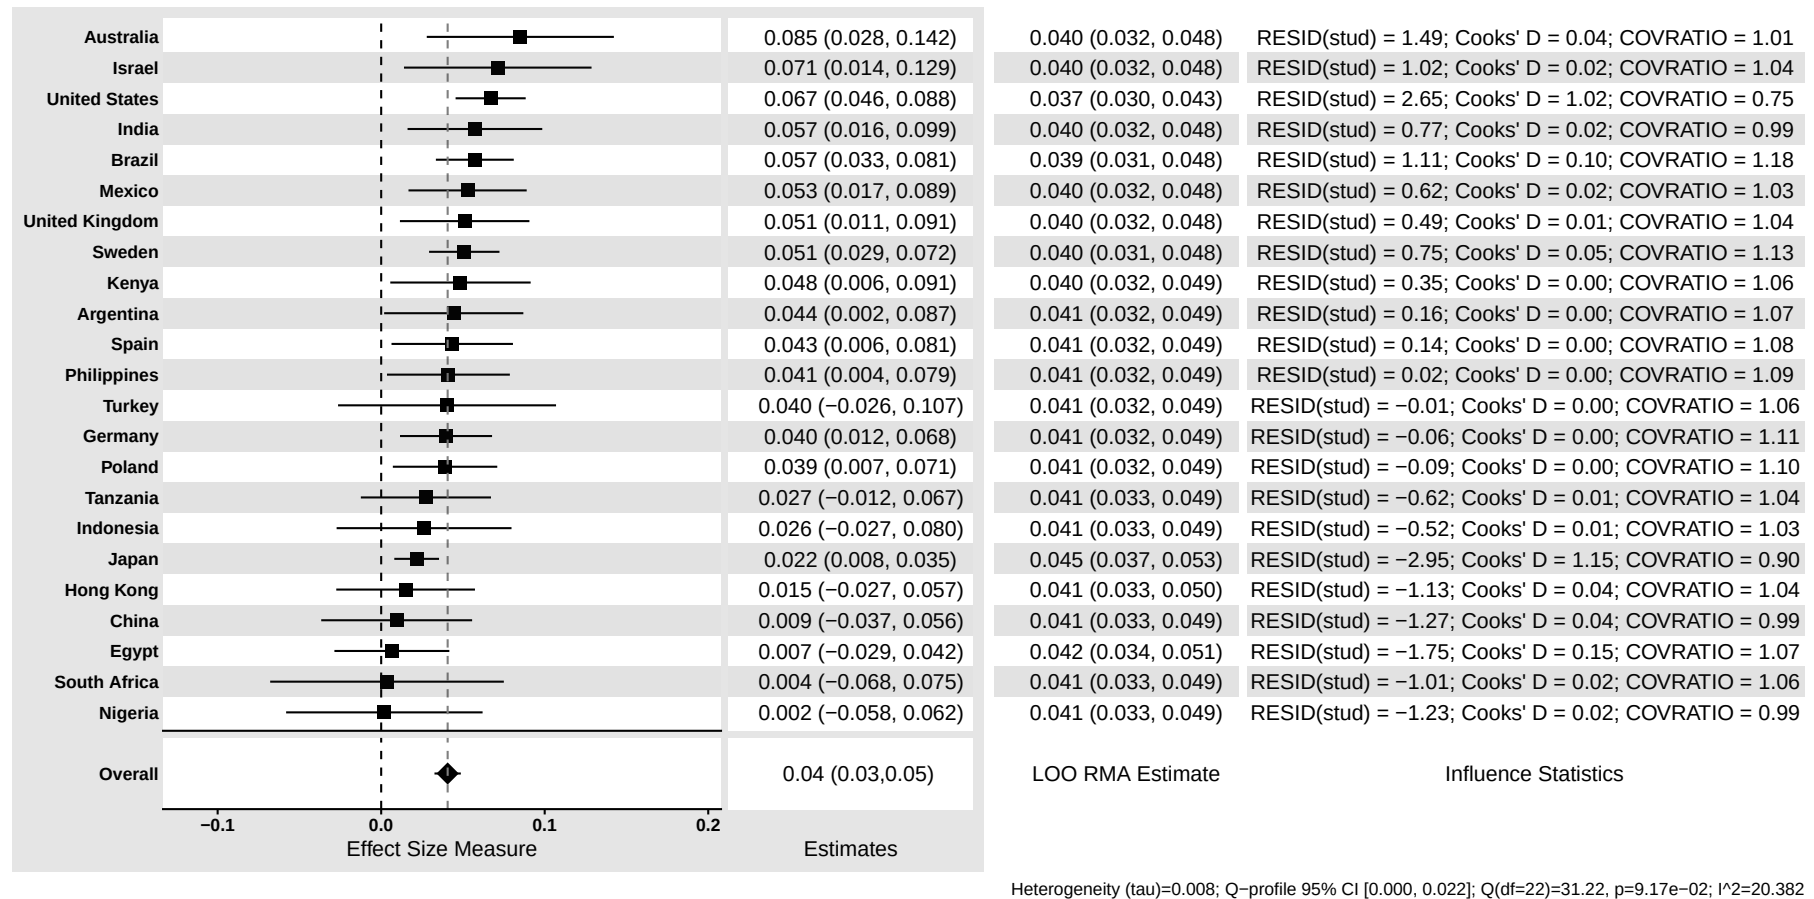

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S72. Heterogeneity in the effects of religious/spiritual comfort at Wave 2 on secure flourishing index at Wave 3 scores across countries.

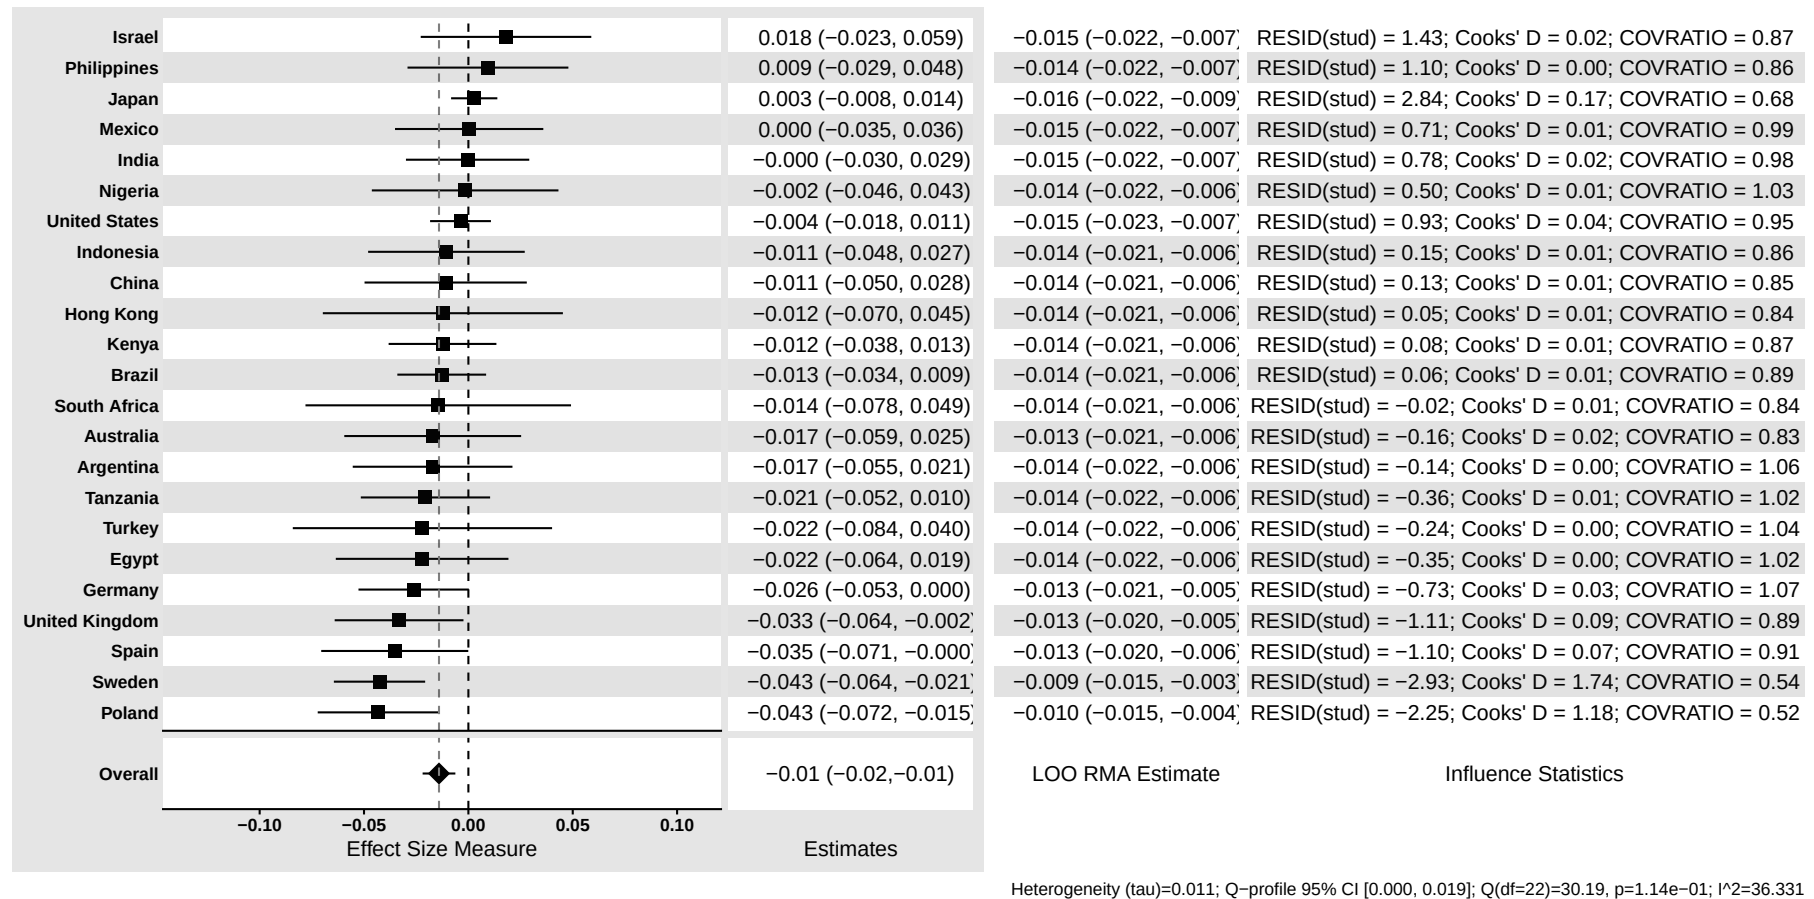

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S73. Heterogeneity in the effects of feel loved by god at Wave 2 on secure flourishing index at Wave 3 scores across countries.

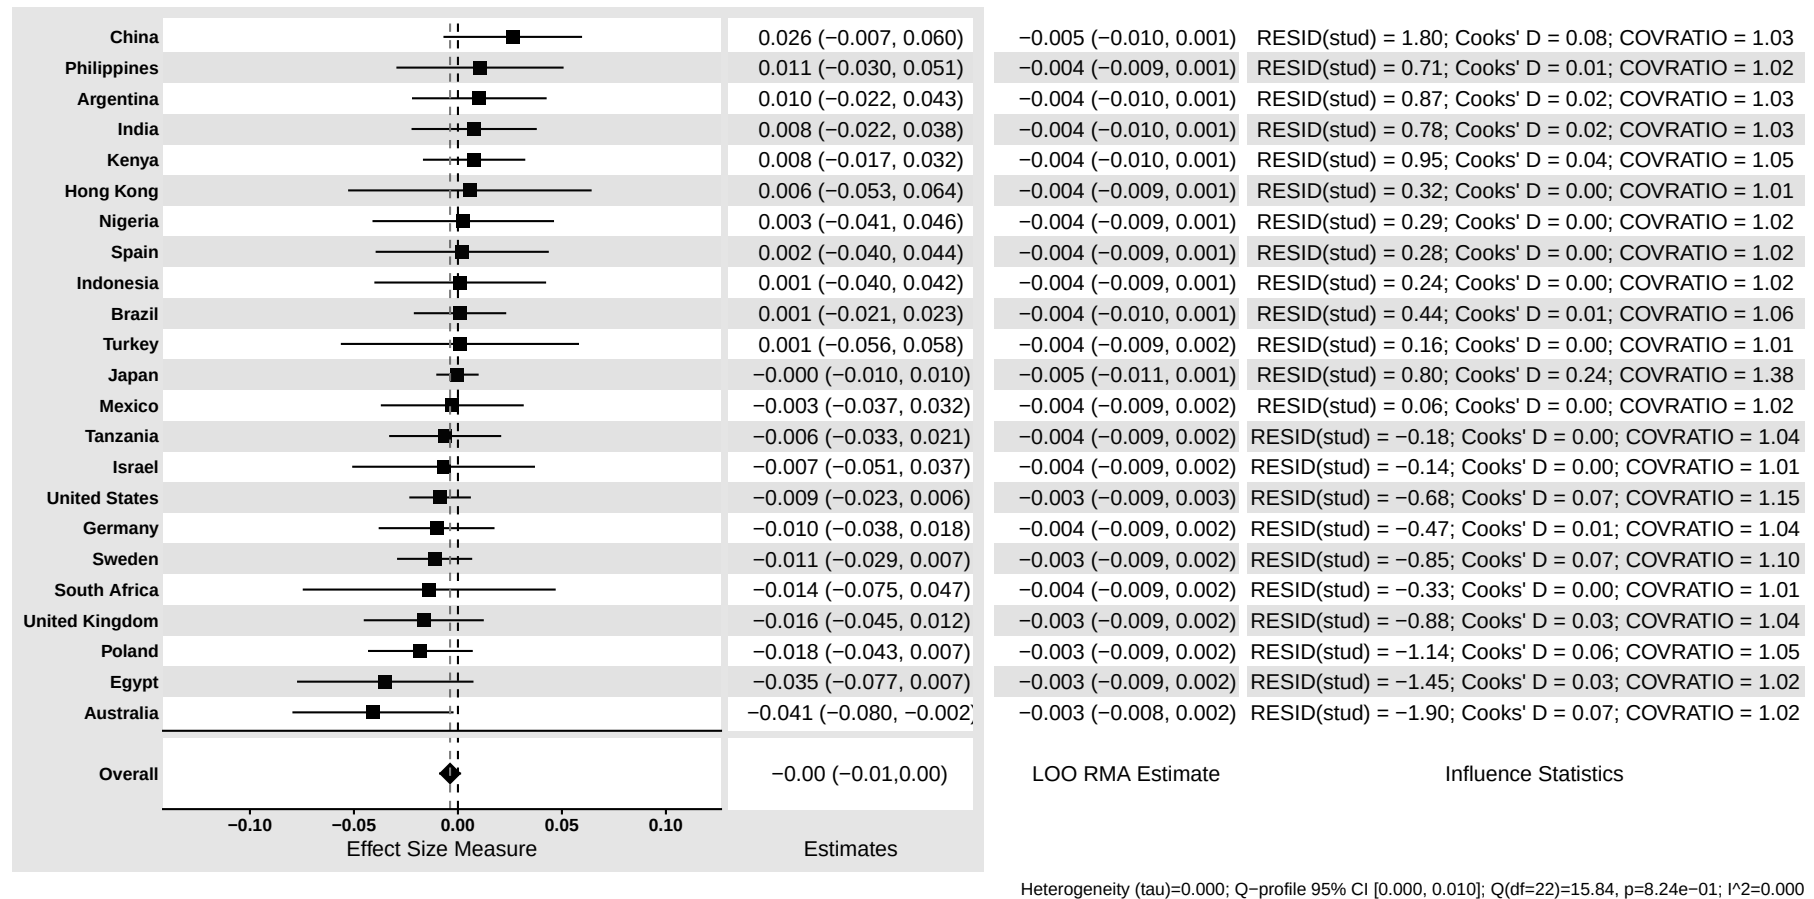

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S74. Heterogeneity in the effects of feel punished by god at Wave 2 on secure flourishing index at Wave 3 scores across countries.

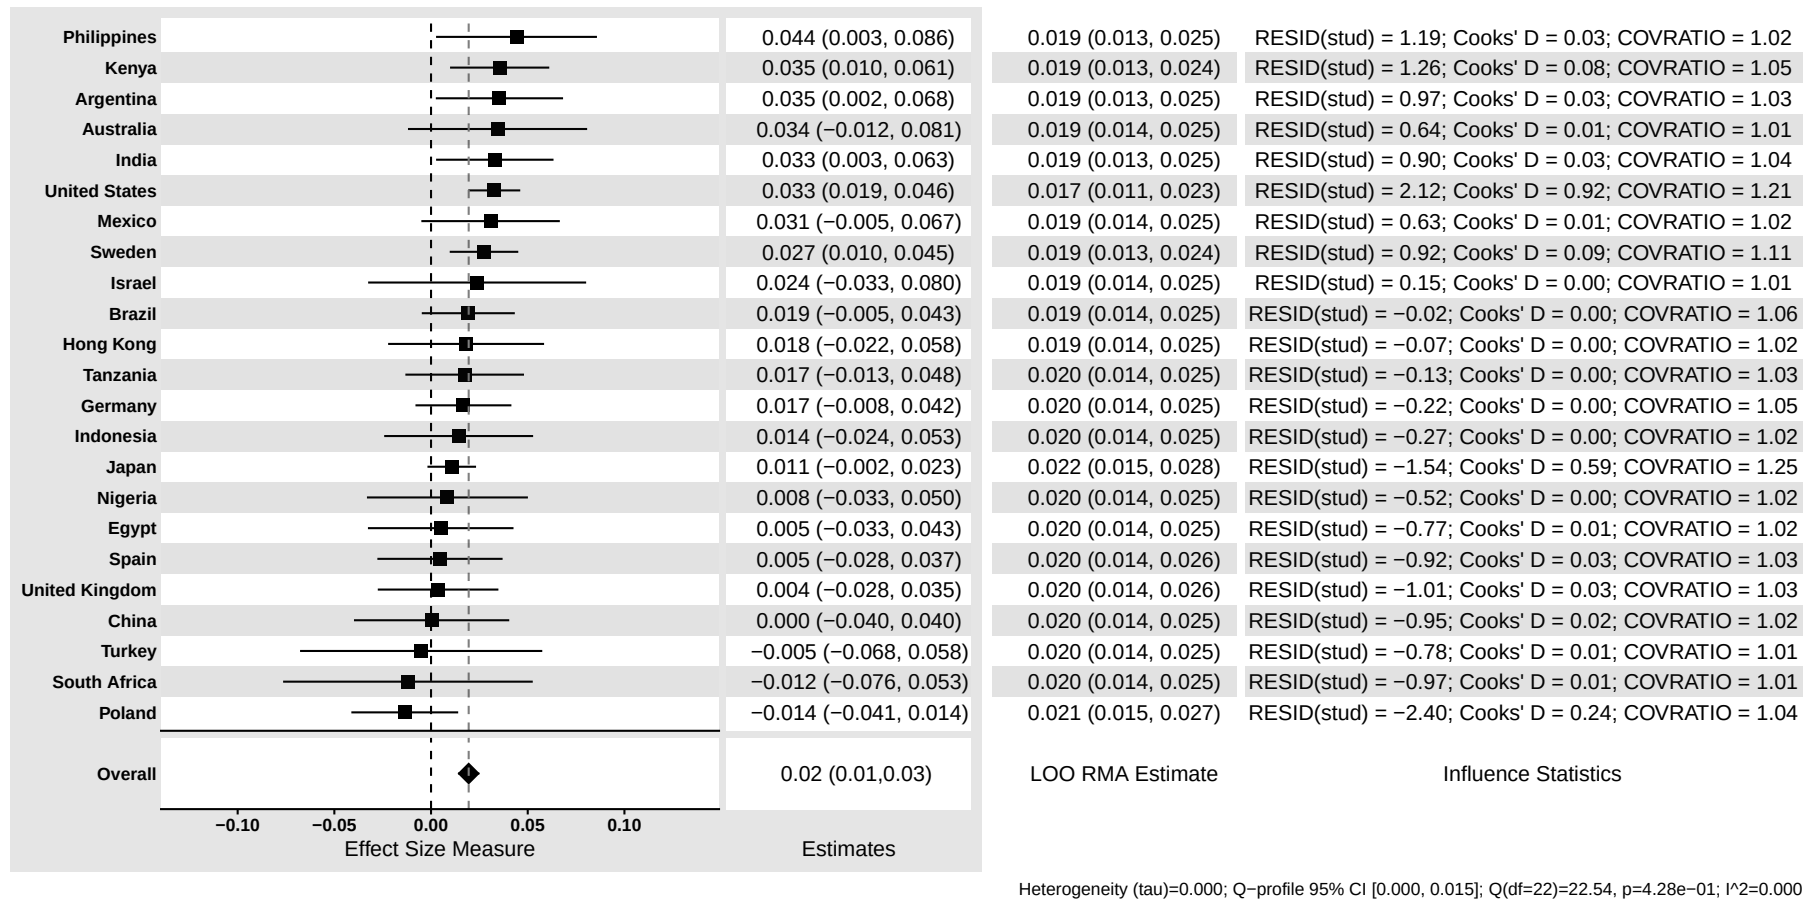

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \cdot SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S75. Heterogeneity in the effects of experienced religious criticism at Wave 2 on secure flourishing index at Wave 3 scores across countries.

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Figure S76. Heterogeneity in the effects of faith-sharing at Wave 2 on secure flourishing index at Wave 3 scores across countries.

Notes. N=207,919; estimated effects computed accounting for the complex sampling design separately by country; Effect size estimate is based on the weighted least squares model for an approximately continuous outcome: for a one unit change in the predictor, how much on average, does the outcome change; Analyses conducted for this plot: Random-effects meta-analysis of country-specific effects; LOO, leave-one-country-out (the country in each row is omitted) estimates of the random-effect meta-analysis are also provided; RESID(stud) studentized residual for each country; Cooks's D-like metric of the influence on the point estimate; COVRATIO, the ratio of the estimated tau (heterogeneity) when row i's country is omitted over all countries estimate of tau. The plot provides the estimates from the primary analysis model that controls for demographic and childhood variables and the entire set of Wave 1 potential confounders via using principal components. The points represent the estimated effect size in each country. The lines represented the $\pm t(df) \times SE$, standard error, around the estimate; the overall pooled mean is represented by the diamond. The reported p-value for Q-statistics is necessarily 1-sided because of the use of the chi-squared distribution to test whether heterogeneity is greater than zero (i.e., a two-sided test is not applicable). No adjustments were made for multiple testing.

Table S9a. Weighted summary statistics for demographic and childhood variables in Argentina

	Wave 1	Wave 2	Wave 3
Characteristic	N = 6,724	N = 2,932	N = 2,322
<i>Secure flourishing index</i>			
Mean (Standard Deviation)	7.13 (1.47)	7.07 (1.38)	6.98 (1.55)
Min, Max	0.42, 10.00	0.42, 10.00	0.42, 10.00
Q1, Q3	6.25, 8.17	6.25, 8.08	6.08, 8.00
(Missing)	209 (3.1%)	62 (2.1%)	37 (1.6%)
<i>Year of birth, n (%)</i>			
1943 or earlier (current age: 80+ years)	112 (1.7%)	64 (2.2%)	55 (2.4%)
1943-1953 (current age: 70-79 years)	356 (5.3%)	177 (6.0%)	171 (7.4%)
1953-1963 (current age: 60-69 years)	730 (10.9%)	328 (11.2%)	254 (10.9%)
1963-1973 (current age: 50-59 years)	1,014 (15.1%)	510 (17.4%)	394 (17.0%)
1973-1983 (current age: 40-49 years)	1,254 (18.6%)	587 (20.0%)	479 (20.6%)
1983-1993 (current age: 30-39 years)	1,432 (21.3%)	603 (20.6%)	503 (21.7%)
1993-1998 (current age: 25-29 years)	719 (10.7%)	284 (9.7%)	193 (8.3%)
1998-2005 (current age: 18-24 years)	1,108 (16.5%)	379 (12.9%)	274 (11.8%)
(Missing)	0 (0%)	0 (0%)	0 (0%)
<i>Age of participant</i>			
Mean (Standard Deviation)	42.43 (16.67)	44.31 (16.49)	45.22 (16.57)

Faith-sharing	1.333	1.075	1.293	1.000	1.310	1.000	1.265	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S10f. Australia analyses of the associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 using only participants who completed all waves (n=96,684, semi-complete-case-analysis) by analysis model (Model 1 vs. Model 2).

Exposure	Model 1 - implicit control of baseline value of exposure							Model 2 - explicit control of baseline value of exposure						
	Estimates				Reliability Corrected Est. (95% CI)			Estimates				Reliability Corrected Est. (95% CI)		
	ES	SE	95% CI	p-value	High (r=0.70)	Moderate (r=0.55)	Low (r=0.40)	ES	SE	95% CI	p-value	High (r=0.70)	Moderate (r=0.55)	Low (r=0.40)

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S11b. Weighted summary statistics for outcome variables in Brazil

Variable	Wave 1 N = 13,200	Wave 2 N = 4,274	Wave 3 N = 3,486
<i>Happiness & life satisfaction</i>

Feel punished by God	1.214	1.000	1.222	1.000	1.296	1.000	1.313	1.000
Experienced religious criticism	1.053	1.000	1.050	1.000	1.146	1.000	1.119	1.000
Faith-sharing	1.232	1.000	1.235	1.000	1.216	1.000	1.280	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S12a. Weighted summary statistics for demographic and childhood variables in China

Feel punished by God	1.348	1.000	1.366	1.000	1.411	1.000	1.430	1.000
Experienced religious criticism	1.366	1.000	1.361	1.000	1.465	1.000	1.441	1.000
Faith-sharing	1.106	1.000	1.104	1.000	1.168	1.000	1.172	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S14a. Weighted summary statistics for demographic and childhood variables in Germany

	Wave 1	Wave 2	Wave 3
Characteristic	N = 9,506	N = 5,529	N = 4,497

(Missing)	99 (1.0%)	42 (0.8%)	22 (0.5%)

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S14b. Weighted summary statistics for outcome variables in Germany

Variable	Wave 1 N = 9,506	Wave 2 N = 5,529	Wave 3 N = 4,497
<i>Happiness & life satisfaction</i>			
Mean (Standard Deviation)	6.92 (1.91)	6.74 (1.89)	6.79 (1.93)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.00	5.50, 8.00	5.50, 8.00
(Missing)	44 (0.5%)	27 (0.5%)	42 (0.9%)
<i>Physical & mental health</i>			
Mean (Standard Deviation)	6.83 (1.93)	6.73 (1.90)	6.78 (1.88)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00

Future life evaluation	1.405	1.366	1.355	1.309	1.513	1.462	1.484	1.426
Optimism	1.354	1.316						

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S15b. Weighted summary statistics for outcome variables in Hong Kong

Variable	Wave 1 N = 3,012	Wave 2 N = 707	Wave 3 N = 390
<i>Happiness & life satisfaction</i>

Faith-sharing	1.261	1.000	1.191	1.000	1.205	1.000	1.076	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S19b. Weighted summary statistics for outcome variables in Japan

Happiness & life satisfaction			
Mean (Standard Deviation)	6.14 (2.15)	5.87 (2.19)	5.81 (2.21)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.00, 8.00	5.00, 7.50	4.50, 7.50
(Missing)	189 (0.9%)	198 (1.4%)	152 (1.4%)
Physical & mental health			
Mean (Standard Deviation)	6.09 (2.01)	5.97 (2.03)	5.91 (2.04)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.00, 7.50	5.00, 7.50	4.50, 7.50
(Missing)	88 (0.4%)	72 (0.5%)	43 (0.4%)
Meaning & purpose			
Mean (Standard Deviation)	5.83 (2.10)	5.70 (2.13)	5.62 (2.17)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.00, 7.50	4.50, 7.00	4.50, 7.00
(Missing)	185 (0.9%)	110 (0.8%)	86 (0.8%)
Character & virtue			
Mean (Standard Deviation)	5.64 (1.77)	5.55 (1.79)	5.49 (1.82)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.00, 7.00	4.50, 6.50	4.50, 6.50
(Missing)	168 (0.8%)	81 (0.6%)	78 (0.7%)
Close social relationships			
Mean (Standard Deviation)	5.96 (2.22)	5.82 (2.24)	5.77 (2.26)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00

Faith-sharing	1.278	1.000	1.258	1.000	1.332	1.000	1.335	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S20b. Weighted summary statistics for outcome variables in Kenya

	Wave 1 N = 11,389	Wave 2 N = 7,698	Wave 3 N = 7,796
Variable			
<i>Happiness & life satisfaction</i>			
Mean (Standard Deviation)	6.62 (2.67)	6.32 (2.70)	6.22 (2.66)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.00, 9.00	5.00, 8.50	5.00, 8.00
(Missing)	22 (0.2%)	12 (0.2%)	6 (<0.1%)
<i>Physical & mental health</i>			
Mean (Standard Deviation)	8.40 (2.06)	8.00 (2.26)	7.97 (2.22)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S21a. Weighted summary statistics for demographic and childhood variables in Mexico

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S21b. Weighted summary statistics for outcome variables in Mexico

Happiness & life satisfaction				
Mean (Standard Deviation)	7.82 (1.93)	7.66 (1.88)	7.58 (1.94)	
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00	
Q1, Q3	7.00, 9.00	7.00, 9.00	6.50, 9.00

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S22a. Weighted summary statistics for demographic and childhood variables in Nigeria

	Wave 1	Wave 2	Wave 3
Characteristic	N = 6,827	N = 3,146	N = 3,250

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2. Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S24b. Weighted summary statistics for outcome variables in Poland

Happiness & life satisfaction			
Mean (Standard Deviation)	7.54 (1.56)	7.83 (1.38)	7.83 (1.46)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.50, 8.50	7.00, 8.50	7.00, 9.00
(Missing)	124 (1.2%)	32 (0.5%)	13 (0.2%)
Physical & mental health			
Mean (Standard Deviation)	7.87 (1.68)	8.11 (1.53)	8.04 (1.63)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.00, 9.00	7.50, 9.50	7.00, 9.50
(Missing)	42 (0.4%)	46 (0.7%)	3 (<0.1%)
Meaning & purpose			
Mean (Standard Deviation)	7.74 (1.67)	7.95 (1.46)	7.93 (1.47)
Min, Max	0.00, 10.00	0.00, 10.00	0.50, 10.00
Q1, Q3	7.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	88 (0.8%)	32 (0.5%)	39 (0.7%)
Character & virtue			
Mean (Standard Deviation)	7.36 (1.61)	7.60 (1.40)	7.44 (1.57)
Min, Max	0.00, 10.00	1.00, 10.00	0.00, 10.00
Q1, Q3	6.50, 8.50	7.00, 8.50	6.50, 8.50
(Missing)	80 (0.8%)	42 (0.6%)	24 (0.5%)
Close social relationships			
Mean (Standard Deviation)	7.66 (1.75)	7.77 (1.55)	7.80 (1.58)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	211 (2.0%)	66 (1.0%)	44 (0.8%)
Financial & material security			
Mean (Standard Deviation)	7.16 (2.26)	7.68 (1.91)	7.63 (1.88)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	98 (0.9%)	30 (0.5%)	27 (0.5%)
Happiness (a)			
Mean (Standard Deviation)	7.55 (1.60)	7.85 (1.41)	7.84 (1.51)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	15 (0.1%)	13 (0.2%)	3 (<0.1%)
Life satisfaction (a)			
Mean (Standard Deviation)	7.52 (1.73)	7.81 (1.55)	7.82 (1.59)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	110 (1.1%)	21 (0.3%)	11 (0.2%)
Current life evaluation			
Mean (Standard Deviation)	7.12 (1.62)	7.43 (1.46)	7.45 (1.54)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.00	7.00, 8.00	7.00, 8.00
(Missing)	24 (0.2%)	7 (0.1%)	4 (<0.1%)
Future life evaluation			
Mean (Standard Deviation)	7.40 (1.77)	7.59 (1.55)	7.58 (1.66)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	145 (1.4%)	91 (1.4%)	31 (0.6%)
Optimism			
Mean (Standard Deviation)	7.72 (1.83)	7.89 (1.65)	7.94 (1.65)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	32 (0.3%)	29 (0.4%)	12 (0.2%)
Freedom to pursue what's important			
Mean (Standard Deviation)	7.60 (1.87)	7.72 (1.70)	7.76 (1.66)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	60 (0.6%)	24 (0.4%)	14 (0.3%)
Inner peace, n (%)			
Always	1,654 (15.9%)	875 (13.5%)	705 (13.0%)
Often	6,433 (61.9%)	4,284 (66.1%)	3,421 (63.4%)
Rarely	1,953 (18.8%)	1,137 (17.5%)	1,018 (18.9%)
Never	275 (2.6%)	143 (2.2%)	230 (4.3%)
(Missing)	75 (0.7%)	39 (0.6%)	25 (0.5%)
Life balance, n (%)			
Always	1,640 (15.8%)	892 (13.8%)	665 (12.3%)
Often	6,446 (62.0%)	4,193 (64.7%)	3,422 (63.4%)
Rarely	1,962 (18.9%)	1,157 (17.9%)	1,027 (19.0%)

Feel punished by God	1.478	1.237	1.491	1.251	1.431	1.000	1.439	1.000
Experienced religious criticism	1.296	1.000	1.323	1.000	1.395	1.000	1.429	1.055
Faith-sharing	1.202	1.000	1.245	1.000	1.154	1.000	1.270	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S25a. Weighted summary statistics for demographic and childhood variables in South Africa

	Wave 1	Wave 2	Wave 3
Characteristic	N = 2,651	N = 978	N = 606
<i>Secure flourishing index</i>

Faith-sharing	1.181	1.000	1.206	1.000	1.768	1.000	1.834	1.177

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S26a. Weighted summary statistics for demographic and childhood variables in Spain

	Wave 1	Wave 2	Wave 3
Characteristic	N = 6,290	N = 2,924	N = 2,406

Table S26f. Spain analyses of the associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 using only participants who completed all waves (n=96,684, semi-complete-case-analysis) by analysis model (Model 1 vs. Model 2).

Exposure	Model 1 - implicit control of baseline value of exposure							Model 2 - explicit control of baseline value of exposure						
	Estimates				Reliability Corrected Est. (95% CI)			Estimates				Reliability Corrected Est. (95% CI)

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S27b. Weighted summary statistics for outcome variables in Sweden

Happiness & life satisfaction			
Mean (Standard Deviation)	7.06 (1.95)	6.95 (1.91)	6.98 (1.89)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.50	6.00, 8.00	6.00, 8.00
(Missing)	62 (0.4%)	49 (0.4%)	110 (1.1%)
Physical & mental health			
Mean (Standard Deviation)	6.80 (1.85)	6.75 (1.83)	6.78 (1.79)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.50, 8.00	5.50, 8.00	6.00, 8.00
(Missing)	47 (0.3%)	31 (0.3%)	60 (0.6%)
Meaning & purpose			
Mean (Standard Deviation)	6.85 (2.16)	6.90 (2.13)	6.92 (2.12)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.50, 8.50	6.00, 8.50	6.00, 8.50
(Missing)	165 (1.1%)	120 (1.0%)	158 (1.5%)
Character & virtue			
Mean (Standard Deviation)	7.28 (1.56)	7.37 (1.50)	7.43 (1.51)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.50, 8.50	6.50, 8.50	6.50, 8.50
(Missing)	171 (1.1%)	169 (1.5%)	240 (2.3%)
Close social relationships			
Mean (Standard Deviation)	7.23 (2.23)	7.30 (2.18)	7.30 (2.19)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	6.00, 9.00	6.00, 9.00
(Missing)	96 (0.6%)	78 (0.7%)	100 (1.0%)
Financial & material security			
Mean (Standard Deviation)	7.36 (2.49)	7.39 (2.48)	7.49 (2.48)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.50	6.00, 9.50	6.00, 9.50
(Missing)	64 (0.4%)	47 (0.4%)	78 (0.8%)
Happiness (a)			
Mean (Standard Deviation)	7.03 (1.96)	6.95 (1.92)	6.98 (1.88)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.00	6.00, 8.00	6.00, 8.00
(Missing)	38 (0.3%)	18 (0.2%)	49 (0.5%)
Life satisfaction (a)			
Mean (Standard Deviation)	7.09 (2.07)	6.95 (2.05)	6.98 (2.02)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	6.00, 8.00	6.00, 8.00
(Missing)	34 (0.2%)	32 (0.3%)	77 (0.7%)
Current life evaluation			
Mean (Standard Deviation)	7.20 (1.76)	6.73 (1.72)	6.79 (1.69)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.00	6.00, 8.00	6.00, 8.00
(Missing)	45 (0.3%)	13 (0.1%)	62 (0.6%)
Future life evaluation			
Mean (Standard Deviation)	7.70 (1.76)	7.42 (1.86)	7.40 (1.82)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.00, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	43 (0.3%)	48 (0.4%)	95 (0.9%)
Optimism			
Mean (Standard Deviation)	7.30 (2.32)	7.31 (2.27)	7.35 (2.25)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	6.00, 9.00	6.00, 9.00
(Missing)	52 (0.3%)	44 (0.4%)	82 (0.8%)
Freedom to pursue what's important			
Mean (Standard Deviation)	7.49 (2.24)	7.39 (2.25)	7.39 (2.27)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	6.00, 9.00	6.00, 9.00
(Missing)	39 (0.3%)	30 (0.3%)	40 (0.4%)
Inner peace, n (%)			
Always	1,723 (11.4%)	1,154 (9.9%)	1,056 (10.1%)
Often	10,561 (70.1%)	8,202 (70.7%)	7,364 (70.6%)
Rarely	2,587 (17.2%)	2,089 (18.0%)	1,842 (17.7%)
Never	136 (0.9%)	120 (1.0%)	92 (0.9%)
(Missing)	61 (0.4%)	44 (0.4%)	71 (0.7%)
Life balance, n (%)			
Always	1,284 (8.5%)	861 (7.4%)	752 (7.2%)
Often	10,643 (70.6%)	8,209 (70.7%)	7,300 (70.0%)
Rarely	2,883 (19.1%)	2,309 (19.9%)	2,136 (20.5%)

Table S27f. Sweden analyses of the associations of well-being and other variables at Wave 2 with secure flourishing index at Wave 3 using only participants who completed all waves (n=96,684, semi-complete-case-analysis) by analysis model (Model 1 vs. Model 2).

Exposure	Model 1 - implicit control of baseline value of exposure							Model 2 - explicit control of baseline value of exposure						
	Estimates				Reliability Corrected Est. (95% CI)			Estimates				Reliability Corrected Est. (95% CI)		
	ES	SE	95% CI	p-value	High (r=0.70)	Moderate (r=0.55)	Low (r=0.40)	ES	SE	95% CI	p-value	High (r=0.70)	Moderate (r=0.55)	Low (r=0.40)

Faith-sharing	1.342	1.182	1.327	1.151	1.305	1.003	1.287	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2. Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S28b. Weighted summary statistics for outcome variables in Tanzania

Happiness & life satisfaction			
Mean (Standard Deviation)	5.96 (2.99)	5.67 (3.08)	5.72 (3.00)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	4.00, 8.50	3.50, 8.50	3.50, 8.00
(Missing)	22 (0.2%)	4 (<0.1%)	7 (0.1%)
Physical & mental health			
Mean (Standard Deviation)	8.39 (2.16)	8.05 (2.38)	7.97 (2.39)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.50, 10.00	6.50, 10.00	6.50, 10.00
(Missing)	40 (0.4%)	16 (0.3%)	2 (<0.1%)
Meaning & purpose			
Mean (Standard Deviation)	7.67 (2.52)	7.35 (2.66)	7.30 (2.61)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 10.00	5.50, 10.00	5.50, 10.00
(Missing)	114 (1.3%)	8 (0.1%)	4 (<0.1%)
Character & virtue			
Mean (Standard Deviation)	7.84 (2.43)	7.69 (2.56)	7.67 (2.50)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 10.00	6.00, 10.00	6.00, 10.00
(Missing)	44 (0.5%)	16 (0.3%)	11 (0.2%)
Close social relationships			
Mean (Standard Deviation)	7.56 (2.76)	7.57 (2.86)	7.72 (2.71)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.50, 10.00	6.00, 10.00	6.50, 10.00
(Missing)	37 (0.4%)	5 (<0.1%)	8 (0.2%)
Financial & material security			
Mean (Standard Deviation)	5.76 (3.29)	5.94 (3.38)	5.87 (3.36)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	3.50, 9.00	3.50, 9.00	3.50, 9.00
(Missing)	21 (0.2%)	5 (<0.1%)	7 (0.1%)
Happiness (a)			
Mean (Standard Deviation)	6.58 (3.26)	6.27 (3.40)	6.19 (3.19)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.00, 10.00	4.00, 10.00	4.00, 9.00
(Missing)	13 (0.1%)	3 (<0.1%)	4 (<0.1%)
Life satisfaction (a)			
Mean (Standard Deviation)	5.33 (3.77)	5.07 (3.79)	5.26 (3.62)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	2.00, 10.00	1.00, 9.00	2.00, 9.00
(Missing)	10 (0.1%)	1 (<0.1%)	6 (0.1%)
Current life evaluation			
Mean (Standard Deviation)	4.40 (3.30)	4.89 (3.34)	4.91 (3.09)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	1.00, 6.00	2.00, 7.00	2.00, 7.00
(Missing)	17 (0.2%)	0 (<0.1%)	3 (<0.1%)
Future life evaluation			
Mean (Standard Deviation)	6.66 (3.04)	6.83 (3.10)	6.77 (2.95)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.00, 10.00	5.00, 10.00	5.00, 10.00
(Missing)	601 (6.6%)	90 (1.6%)	43 (0.8%)
Optimism			
Mean (Standard Deviation)	8.75 (2.36)	8.41 (2.85)	8.42 (2.73)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	8.00, 10.00	8.00, 10.00	8.00, 10.00
(Missing)	16 (0.2%)	8 (0.1%)	4 (<0.1%)
Freedom to pursue what's important			
Mean (Standard Deviation)	8.45 (2.58)	8.17 (2.92)	8.03 (2.95)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	8.00, 10.00	7.00, 10.00	7.00, 10.00
(Missing)	10 (0.1%)	2 (<0.1%)	0 (0%)
Inner peace, n (%)			
Always	2,879 (31.7%)	1,462 (26.2%)	1,438 (27.2%)
Often	2,694 (29.7%)	1,534 (27.5%)	1,499 (28.3%)
Rarely	3,291 (36.3%)	2,415 (43.3%)	2,227 (42.1%)
Never	202 (2.2%)	167 (3.0%)	129 (2.4%)
(Missing)	9 (0.1%)	5 (0.1%)	0 (0%)
Life balance, n (%)			
Always	1,759 (19.4%)	830 (14.9%)	840 (15.9%)
Often	2,213 (24.4%)	1,183 (21.2%)	1,035 (19.6%)
Rarely	4,678 (51.5%)	3,278 (58.7%)	3,197 (60.4%)
Never	393 (4.3%)	285 (5.1%)	220 (4.2%)
(Missing)	33 (0.4%)	7 (0.1%)	2 (0.0%)
Sense of mastery, n (%)			
Always	3,267 (36.0%)	1,804 (32.3%)	1,631 (30.8%)
Often	2,678 (29.5%)	1,467 (26.3%)	1,525 (28.8%)
Rarely	2,936 (32.4%)	2,149 (38.5%)	2,042 (38.6%)
Never	171 (1.9%)	162 (2.9%)	95 (1.8%)
(Missing)	22 (0.2%)	1 (0.0%)	0 (0%)
Meaningful activities (c)			
Mean (Standard Deviation)	7.30 (3.21)	6.97 (3.33)	7.00 (3.23)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00

Faith-sharing	1.267	1.000	1.238	1.000	1.253	1.000	1.224	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2, Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S29b. Weighted summary statistics for outcome variables in Turkey

Variable	Wave 1 N = 1,473	Wave 2 N = 500	Wave 3 N = 359
<i>Happiness & life satisfaction</i>

Feel loved by God	1.406	1.000	1.390	1.000	1.539	1.000	1.751	1.000
Feel punished by God	1.259	1.000	1.251	1.000	2.070	1.447	2.218	1.577
Experienced religious criticism	1.044	1.000	1.042	1.000	1.281	1.000	1.240	1.000
Faith-sharing	1.108	1.000	1.132	1.000	1.478	1.000	1.603	1.000

Notes. EE, E-value for estimate; ECI, E-value for the limit of the confidence interval; Model 1, primary analysis model where all non demographic variable included through the use of principal components analyses; Model 2, supplemental model where wave 1 value of the varying exposure at Wave 2 included explicitly as a control variable and not through the principal components. The formula for calculating E-values can be found in VanderWeele and Ding (2017). E-values for estimate are the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to fully explain away the observed association between the exposure and outcome, conditional on the measured covariates. E-values for the 95% CI closest to the null denote the minimum strength of association on the risk ratio scale that an unmeasured confounder would need to have with both the exposure and the outcome to shift the CI to include the null value, conditional on the measured covariates.

Table S30a. Weighted summary statistics for demographic and childhood variables in United Kingdom

Characteristic	Wave 1 N = 5,368	Wave 2 N = 3,619	Wave 3 N = 3,172
<i>Secure flourishing index</i>

Note. N (%); this table is based on non-imputed data. Cumulative percentages for variables may not add up to 100% due to rounding. Wave 1 characteristics weighted using the Gallup provided sampling weight, ANNUAL_WEIGHT_C1; Wave 2 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C2. Wave 3 characteristics weighted accounting for attrition by using the adjusted Wave 1 weight, ANNUAL_WEIGHT_C3.

Table S31b. Weighted summary statistics for outcome variables in United States

Happiness & life satisfaction			
Mean (Standard Deviation)	6.93 (1.95)	6.88 (1.88)	6.76 (1.94)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.00	6.00, 8.00	5.50, 8.00
(Missing)	61 (0.2%)	89 (0.3%)	68 (0.3%)
Physical & mental health			
Mean (Standard Deviation)	7.00 (1.83)	7.00 (1.76)	6.91 (1.82)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.50	6.00, 8.50	6.00, 8.00
(Missing)	42 (0.1%)	820 (2.5%)	18 (<0.1%)
Meaning & purpose			
Mean (Standard Deviation)	7.14 (2.18)	7.20 (2.08)	7.16 (2.14)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	6.00, 9.00	6.00, 9.00
(Missing)	70 (0.2%)	155 (0.5%)	71 (0.3%)
Character & virtue			
Mean (Standard Deviation)	7.66 (1.60)	7.66 (1.51)	7.66 (1.51)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.50, 9.00	7.00, 9.00	7.00, 9.00
(Missing)	187 (0.5%)	127 (0.4%)	78 (0.3%)
Close social relationships			
Mean (Standard Deviation)	7.18 (2.31)	7.23 (2.21)	7.20 (2.25)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	6.00, 9.00	6.00, 9.00
(Missing)	128 (0.3%)	82 (0.3%)	57 (0.2%)
Financial & material security			
Mean (Standard Deviation)	6.75 (2.87)	6.88 (2.78)	6.84 (2.82)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	5.00, 9.00	5.00, 9.00	5.00, 9.00
(Missing)	54 (0.1%)	62 (0.2%)	41 (0.2%)
Happiness (a)			
Mean (Standard Deviation)	7.01 (1.92)	6.95 (1.88)	6.85 (1.92)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.00	6.00, 8.00	6.00, 8.00
(Missing)	20 (<0.1%)	44 (0.1%)	23 (<0.1%)
Life satisfaction (a)			
Mean (Standard Deviation)	6.86 (2.14)	6.81 (2.02)	6.66 (2.11)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.00	6.00, 8.00	5.00, 8.00
(Missing)	41 (0.1%)	46 (0.1%)	53 (0.2%)
Current life evaluation			
Mean (Standard Deviation)	6.94 (1.85)	6.75 (1.81)	6.67 (1.83)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 8.00	6.00, 8.00	6.00, 8.00
(Missing)	21 (<0.1%)	21 (<0.1%)	32 (0.1%)
Future life evaluation			
Mean (Standard Deviation)	7.73 (1.93)	7.46 (1.97)	7.27 (2.09)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	7.00, 9.00	7.00, 9.00	6.00, 9.00
(Missing)	105 (0.3%)	64 (0.2%)	42 (0.2%)
Optimism			
Mean (Standard Deviation)	7.65 (2.29)	7.61 (2.22)	7.50 (2.32)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 10.00	6.00, 9.00	6.00, 9.00
(Missing)	185 (0.5%)	167 (0.5%)	28 (0.1%)
Freedom to pursue what's important			
Mean (Standard Deviation)	7.21 (2.53)	7.13 (2.47)	7.02 (2.56)
Min, Max	0.00, 10.00	0.00, 10.00	0.00, 10.00
Q1, Q3	6.00, 9.00	6.00, 9.00	6.00, 9.00
(Missing)	41 (0.1%)	22 (<0.1%)	22 (<0.1%)
Inner peace, n (%)			
Always	6,176 (16.1%)	5,054 (15.7%)	4,066 (15.9%)
Often	23,864 (62.3%)	20,612 (63.9%)	16,345 (64.0%)
Rarely	7,551 (19.7%)	5,511 (17.1%)	4,739 (18.6%)
